CHAPTER 1

Introduction

Welcome to Parallels Remote Application Server, an integrated solution to virtualize your applications, desktops and data. Parallels Remote Application Server publishes applications and delivers remote and virtual desktops to any device on your network, anywhere.

In This Chapter

About Parallels Remote Application Server	10
About This Guide	11
Terms and Abbreviations Used in This Guide.....	11

About Parallels Remote Application Server

Parallels Remote Application Server provides vendor independent virtual desktop and application delivery from a single platform. Accessible from anywhere with platform-specific clients and web enabled solutions, like the Parallels RAS HTML5 Gateway, Parallels Remote Application Server allows you to publish remote desktops, applications and documents within a virtual environment, improving desktop manageability, security and performance.

Parallels Remote Application Server extends Windows Remote Desktop Services by using a customized shell and virtual channel extensions over the Microsoft RDP protocol. It supports all major hypervisors from Microsoft, VMware, and other vendors enabling the publishing of virtual desktops and applications to Parallels Client.

The product includes powerful universal printing and scanning functionality, as well as high capacity resource based load balancing and management features.

With Parallels Client Manager Module for Parallels Remote Application Server you can also centrally manage user connections and PCs converted into thin clients using the free Parallels Client.

How does it work?

When a user requests an application or a desktop, the system finds a least loaded RD Session Host or a guest VM on one of the least loaded VDI hosts and establishes an RDP connection with it. Using Microsoft RDP protocol, the requested application or desktop is presented to the user.

Users can connect to Parallels Remote Application Server using Parallels Client (available at no charge), which can run on Windows, Linux, macOS, Android, Chrome, and iOS. Users can also connect via an HTML5 browser or Chromebook.

As newer versions of Windows keep on being developed as time goes by, you need to defend the migration cost to your business. Parallels Remote Application Server can help. Desktop replacement allows you to extend the lifespan of your hardware and delay migration to the latest OSs to a time that suits you best. The Parallels Remote Application Server solution allows you to be very flexible: you can lock machine configurations on the user side, placing your corporate data in an extremely secure position; or you can opt to allow users to run some local and remote applications. Parallels Client Desktop Replacement is able to reduce the operability of the local machine by disabling the most common local configuration options, while guaranteeing the same level of service and security afforded by thin clients, directly from your existing PCs.

About This Guide

This guide is intended for system administrators responsible for installing, configuring, and administering Parallels Remote Application Server. This guide assumes that the reader is familiar with Microsoft Remote Desktop Services and has an intermediate networking knowledge.

Terms and Abbreviations Used in This Guide

The following terms and abbreviations are used in this guide:

Term/Abbreviation	Description
RAS Console	Parallels Remote Application Server Console. The RAS console is the primary interface you use to configure, manage, and run Parallels Remote Application Server. As an administrator, you use the RAS console to manage farms, sites, RD Session Hosts, published resources, client connections, etc.
Category	In the RAS console, categories are displayed in the left pane of the main window. Each category consists of a number of settings related to a specific task or operation. The categories include Start, Farm, Load Balancing, Publishing, Universal Printing, Universal Scanning, Connection, Client Manager, and others.
Farm	A Parallels RAS farm is a logical grouping of objects for the purpose of centralized management. A farm configuration is stored in a single database which contains information about all objects comprising the farm. A farm consists of at least one site, but may have as many sites as necessary.
Site	A site consists of at least one RAS Publishing Agent, RAS Secure Client Gateway (or multiple gateways), and RAS agents installed on RD Session Hosts, VDI hosts, and Windows PCs. Note that a given RD

	Session Host, VDI host, or PC can be a member of only one site at any given time.
Licensing Site	The site that manages Parallels RAS licenses in a Parallels RAS farm. By default, the server on which you install Parallels RAS becomes the Licensing Site. If you create additional sites later, you can designate any one of them as the Licensing Site. There can be only one Licensing Site in a given farm. All other sites are called secondary sites. Note: Parallels RAS updates or upgrades must be applied to the Licensing Site first.
RAS Secure Client Gateway	RAS Secure Client Gateway tunnels all traffic needed by applications on a single port and provides secure connections.
HTML5 Client	HTML5 client allows users to view and launch remote applications and desktops in a web browser. The HTML5 client functionality is a part of RAS Secure Client Gateway.
Publishing	The act of making items installed on a Remote Desktop Server, VDI host or Remote PC available to the users via the Parallels Remote Application Server.
RAS Publishing Agent	RAS Publishing Agent provides load balancing of published applications and desktops.
RAS RD Session Host Agent	RAS RD Session Host Agent collects information from the MS RDS hosts required by the Publishing Agent and transmits to it when required.
Remote PC Agent	Remote PC Agent collects information from Remote PC hosts required by the Publishing Agent and transmits to it when required.
RAS Guest Agent	RAS Guest Agent collects information from the VDI desktop required by the Publishing Agent and transmits to it when required.
RAS VDI Agent	RAS VDI Agent collects information from the Parallels Remote Application Server Infrastructure and is responsible for controlling VDI through its native API. It also acts as a gateway between the Secure Client Gateway or the client in direct mode and the RDP server from the guest VM or VDI depending on VDI implementation.
RAS Web Portal	RAS Web Portal is a web page with auto client detection and a client distribution point. It provides access to published resources via web browser.
RDS	Remote Desktop Services is a Microsoft Windows component that makes applications and the entire desktop of a server running RDS accessible to a remote client device that supports Remote Desktop Protocol (RDP). RDS replaced Terminal Services beginning with Windows 2008 R2.

HALB	High Availability Load Balancing (HALB) is an appliance that provides load balancing for RAS Secure Client Gateways. Parallels HALB virtual appliance is available for the following hypervisors: Hyper-V, VMware, XenServer. HALB deployment is per site, which means that a site must have at least one Parallels HALB appliance deployed. Multiple HALB deployments can run simultaneously, one acting as the master and others as slaves. The more HALB deployments a site has, the lower the probability that end users will experience downtime. Master and slave HALB deployments share a common or virtual IP address (VIP). Should the master HALB deployment fail, a slave is promoted to master and takes its place.
Parallels RAS PowerShell	Parallels RAS PowerShell allows you to perform Parallels RAS administrative tasks using PowerShell cmdlets. You can execute cmdlets in the Windows PowerShell console or you can write scripts to perform common Parallels RAS administrative tasks. A complete guide to Parallels RAS PowerShell is available on the Parallels website together with other Parallels RAS documentation.

CHAPTER 2

Installing Parallels Remote Application Server

This chapter describes how to install and activate Parallels Remote Application Server.

In This Chapter

System Requirements	14
Install Parallels Remote Application Server	17
Log In and Activate Parallels RAS	18

System Requirements

Before installing Parallels RAS, please verify that your hardware and software meet or exceed hardware and software requirements described below. Please note that although Parallels RAS can be used in Workgroup environment, Parallels recommends using Active Directory to manage users, groups, and machine accounts via group policies.

Hardware Requirements

Parallels Remote Application Server is extensively tested on both physical and virtual platforms. The minimum hardware requirements approved to run Parallels Remote Application Server are outlined below.

- Physical Machines – Dual Core Processor and a minimum of 4GB RAM.
- Virtual Machines – Two Virtual Processors and a minimum of 4GB of virtual hardware memory.

The server hardware requirements to install and configure Parallels Remote Application Server can vary according to end-user requirements.

Typically for an installation of 30 users or under, Parallels Remote Application Server can be installed on one high specification server and the resources published directly from it. For more than 30 users, multiple servers may be required.

The below should be considered during the planning stage of a Parallels Remote Application Server deployment:

- High specification servers should be used, consisting of multiple CPU cores, a high specification disk transfer rate and plenty of RAM.
- A hypervisor-based virtual machine can be used as long as the resources required by the end-users are calculated accordingly.
- RD Session Hosts should not exceed 50 users per RD Session Host in usage.
- RAS Secure Client Gateway should not exceed 200 users per server for incoming connections.
- When planning VDI Hypervisor resource requirements, extra requirements such as RAM usage per virtual machine and disk space should be taken into account.

For port requirements, please see the **Port Reference** section (p. 252).

Software Requirements

RAS Publishing Agent and RAS Secure Client Gateway

RAS Publishing Agent and RAS Secure Client Gateway are supported on the following operating systems:

- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 R2
- Windows Server 2016

As a note, RAS Secure Client Gateway runs as a 64-bit process and takes advantage of multi-core and multi-CPU hardware.

Note: Parallels Remote Application Server should NOT be installed on a domain controller or any other server where a DHCP server is running.

RAS RD Session Host Agent

RAS RD Session Host Agent is supported on the following operating systems:

- Windows Server 2003 SP1 and newer
- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 R2
- Windows Server 2016

RAS VDI Agent

RAS VDI Agent is supported on the following operating systems:

- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 R2
- Windows Server 2016

VMware, Nutanix, and Xenserver can use Windows-based VDI agent installed on Windows Server 2012 R2 and Windows Server 2016

Parallels RAS PowerShell

Windows Server 2008 with Service Pack 2. Windows Management Framework 3.0 must also be installed.

Parallels RAS Console

- Windows Server 2008 and newer
- Windows 7 and newer

RAS Guest Agent

- Windows XP SP3 and newer. Please note that only Windows workstations are supported. The component cannot be installed on a Windows server.

Remote PC Agent

- Windows XP SP3 and newer.
- Windows Server 2008 R2 and newer.

RAS HTML5 Gateway

- Windows Server 2008 R2 or higher.

Parallels Client

Parallels Client is approved for the following operating systems (both 32 bit and 64 bit systems are supported, where applicable):

- Windows XP SP3, Vista, 7, 8.x, 10
- Windows Server 2003 SP1 and newer

- Windows Embedded
- macOS 10.7.3 and newer
- iOS 7.0 and newer (iPhone and iPad)
- Android 2.2 and newer
- Chrome OS
- Ubuntu 12.04 LTS
- Ubuntu 14.04 LTS
- Open Suse 12.3
- OpenSuse 13.2
- Fedora 20
- Xubuntu 15.10
- Raspbian OS Wheezy
- Raspbian OS Jessie

Install Parallels Remote Application Server

To install Parallels Remote Application Server:

- 1 Before proceeding, make sure that you are logged in to the computer where you'll be performing the installation with an account that has administrative privileges.
- 2 Download the latest version of Parallels Remote Application Server from the Parallels website.
- 3 Double click the **RASInstaller.msi** file to launch the Parallels Remote Application Server installation wizard.
- 4 Read the info on the **Welcome** page of this wizard and click **Next**.
- 5 Review and approve the end-user license agreement and click **Next**.
- 6 Specify the location where Parallels Remote Application Server will be installed and click **Next**.
- 7 Select the installation type:
 - **Parallels Remote Application Server.** Run the default installation, which will install all necessary components for a fully functional Parallels RAS farm. When choosing this option, make sure that the server on which you are running the installer meets the requirements of each of the Parallels RAS component.
 - **Custom.** Select and install only the components that you require. You can specify the components you wish to install after clicking **Next**. The list of components available for installation depends on the type of the operating system on which the installer is running. See the **Note** below for the explanation.

Note: The core Parallels RAS components (RAS Publishing Agent, RAS Secure Client Gateway, RAS VDI Agent, RAS RD Session Host Agent) can only be installed on a Windows Server OS (but not on a Windows desktop). The installer automatically detects the type of the Windows OS on which it is running. If it's a Windows desktop (e.g. Windows 10) then the core components will not be available for installation. Components that can be installed on both Windows Server and Windows desktop operating systems include Parallels RAS Console, Parallels RAS PowerShell, RAS Guest Agent, Remote PC Agent.

- 8 Click **Next**.
- 9 Review the notice on the **Important Notice** wizard page. If there's a port conflict on your computer, this information will be displayed here. You can resolve the conflict later.
- 10 Click **Next**.
- 11 On the **Firewall Settings** page, select **Automatically add firewall rules** to configure the firewall on this computer for Parallels RAS to work properly. See **Port Reference** (p. 252) for details.
- 12 Click **Next** and then click **Install**.
- 13 Wait for the installation to finish and click **Finish**.

When you need to install a Parallels RAS component on a different server, run the installation wizard again, select **Custom** when asked to select the installation type, and choose the component you wish to install. For example, you can install Parallels RAS Console on any computer from which you would like to administer Parallels Remote Application Server. For this, you would run the installer on that computer and select just the RAS Console to install.

Log In and Activate Parallels RAS

You administer Parallels Remote Application Server from the Parallels RAS Console. After you've installed Parallels RAS, you need to run the console and activate your new Parallels RAS farm.

Start the Parallels RAS Console

By default, the Parallels RAS Console is launched automatically after you click **Finish** on the last page of the installation wizard. To launch the console manually, navigate to **Start > Apps > Parallels** and click on **Parallels Remote Application Server Console**.

When the Parallels RAS Console is launched for the first time, you are presented with the login dialog where you need to specify the following information:

- **Farm:** A Parallels RAS farm to connect to. Enter the FQDN or IP address of the server where you have RAS Publishing Agent installed. If you've installed all core RAS components on the same server, enter that server name or address. If you've installed all Parallels RAS components on the local server, you can enter "localhost".

- **Username:** A user account with administrative privileges on the server where Parallels RAS is installed (usually a domain or local administrator). The account name must be specified using the UPN format (e.g. `administrator@domain.local`). The specified user will be automatically configured as the Parallels Remote Application Server administrator with full access rights.
- **Password:** The user account password.
- If you select the **Remember credentials** option, this dialog will not be shown the next time you launch the Parallels RAS Console.

Click the **Connect** button to connect to the specified Parallels RAS farm.

Sign in to Parallels My Account

To activate Parallels RAS, you must register for a Parallels business account. After you logged in to Parallels RAS, you'll see the **Sign In to Parallels My Account** dialog. If you already have an account, type the email address and password you used to register the account and click **Sign In**.

If you don't have a Parallels business account, you can register for one as follows:

- 1 In the **Sign In to Parallels My Account** dialog, click **Register**. The **Register Parallels My Account** dialog opens.

If you have an existing 2X Remote Application Server license and are upgrading to the new Parallels Remote Application Server, the **Register Parallels My Account** dialog will be prefilled with the information from your existing license. If you don't have an existing license (or if you've installed Parallels Remote Application Server on a new server), you need to fill in the registration information as described in the next step.

- 2 Enter your name and email address, choose and type a password, and enter your company info (all fields are required).
- 3 Click **Register** to register an account. This will create a personal account for yourself and a business account for your organization to which you will be assigned as administrator.

If you are upgrading an existing 2X license, the **Migrating license key** window will open and your license will be migrated to the new Parallels Remote Application Server format. When the migration is completed, your upgraded license key will be registered with Parallels My Account and your Parallels Remote Application Server will be activated.

If you don't have an existing 2X license, you should see the confirmation message saying that your account has been registered successfully. Click **OK** to close the message box. In the **Sign In to Parallels My Account** dialog, provide the email address and password and click **Sign In**. You'll see the **Activate Product** dialog.

Activate Parallels Remote Application Server

After you sign in to Parallels My Account, the **Activate Product** dialog opens asking you to activate the Parallels RAS farm.

If you already have a Parallels RAS license key, select the **Activate using license key** option and enter the key in the field provided. You can click the button next to the field to see the list of subscriptions and/or permanent license keys you have registered in Parallels My Account. If the list is empty, it means that you don't have any subscriptions or license keys and need to purchase one first.

Note: You can manage your Parallels RAS license using the **Licensing** category in the Parallels RAS console. The management tasks include viewing the license information, switching to a different Parallels My Account, and activating the Parallels RAS farm using a different license key. For more information, please see the **Licensing** section (p. 242).

If you don't have a Parallels RAS subscription or license key, you have the following options:

- Purchase a subscription online by clicking the **Purchase a license** link.
- Activate Parallels RAS as a trial by selecting the **Activate trial version** option.

After entering a license key (or selecting to activate a trial version), click **Activate**. You should see a message that the Parallels RAS farm was activated successfully. Click **OK** to close the message box. The Parallels RAS Console opens where you can administer Parallels Remote Application Server.

The first dialog that you see informs you that you have no servers configured that can be used to host published resources. This means that to begin using Parallels RAS, you need at least one RD Session Host, VDI Host, or a Remote PC configured. We'll talk about configuring a Parallels RAS farm in the next chapter. For now, click **OK** to close the message box. You will then see the **Applying Settings** dialog. Wait for the initial configuration of Parallels RAS to complete and click **OK**. You will now see the main Parallels RAS Console window where you can begin configuring the Parallels RAS farm.

Read on to learn how to quickly add an RD Session Host, publish resources, and invite your users to Parallels RAS.

CHAPTER 3

Getting Started with Parallels Remote Application Server

This chapter will help you get started with Parallels Remote Application Server. Read it to learn how to use the Parallels RAS Console and how to set up a simple RAS environment.

In This Chapter

The Parallels RAS Console	21
Set Up a Basic Parallels RAS Farm.....	23

The Parallels RAS Console

The Parallels RAS Console is a Windows application that you use to configure and administer Parallels Remote Application Server.

Parallels Remote Application Server Console Layout

The Parallels RAS Console consists of the following sections:

- 1** This section lists categories. Selecting a category will populate the right pane with elements relevant to this category.
- 2** This section becomes available only for the **Farm** and the **Publishing** categories. The navigation tree allows you to browse through the objects related to that category.
- 3** This section displays the selected object or category properties, such as servers in a farm or published application properties.
- 4** This information bar displays the name of the site you are currently logged into and your user account name. Please also note the **Press Apply to commit the new settings** message in the middle (in red). The message appears when you make any changes in the console and reminds you that you have to commit these changes to Parallels Remote Application Server. Click the **Apply** button (at the bottom of the screen) to commit the changes.

- 5** The information bar at the bottom of the screen is used to display the most recent console notification (if one is available).

Set Up a Basic Parallels RAS Farm

In this section, we'll set up a basic Parallels RAS farm where all required components run on a single server.

To set up a Parallels RAS farm:

- 1 Log in to the Parallels RAS Console.
- 2 In the console, select the **Start** category. This category gives you access to three wizards that you can use to easily perform essential tasks, such as adding RD Session Hosts, publishing applications, and inviting users to Parallels RAS.

Read on to learn how to add an RD Session Host server (p. 24).

Add an RD Session Host Server

First, you need to add an RD Session Host server to the farm. In this tutorial, we'll add the local server on which Parallels RAS is installed.

To add an RD Session Host server to the farm:

- 1 Click the **Add RD Session Hosts** item. The **Add RD Session Hosts** wizard opens.

- 2 Select one or more servers. You can also type a server name in the edit box at the bottom of the page and then click the plus-sign icon. In this tutorial, we install all Parallels RAS components on a single server, so you can type "localhost".
- 3 Click **Next**.
- 4 On the next page, specify the following options:
 - **Add firewall rules.** Add firewall rules required by Parallels RAS in Windows running on the server. See **Port Reference** (p. 252) for details.

- **Install RDS role.** Install the RDS role on the server if it's not installed. You should always select this option.
- **Enable Desktop Experience.** Enable the Desktop Experience feature in Windows running on the server. This option is enabled only if the Install RDS role option (above) is selected. The option applies to Windows Server 2008 R1/R2 and Windows 2012 R1/R2 on which the Desktop Experience feature is not enabled by default.
- **Restart server if required.** Automatically restart the server if necessary. You can restart the server manually if you wish.
- **Add server(s) to group.** Add the server (or servers) to a group. Select the desired group in the list box located below this option. Groups are described in detail in the **Grouping RD Session Hosts** (p. 53) section. If you are just learning how to use this wizard, you can skip this option.

5 Click **Next**.

6 The next page allows you to add users and groups to the Remote Desktop Users group in Windows running on the server. This is necessary for your Parallels RAS users to be able to access published resources hosted by an RD Session Host. To specify users and/or groups, select the option provided and then click the **[+]** icon. In the **Select Users or Groups** dialog, specify a user or a group and click **OK**. The selected user/group will be added to the list on the wizard page.

Note: If you skip this step and your users are not members of the Remote Desktop Users group on the RD Session Host server, they will not be able to access resources published from this server. If you wish, you can add users to the group using the standard Windows tools. For more information, please consult the Microsoft Windows documentation.

7 Click **Next**.

8 On the next page, review the settings and click **Next**.

9 The **Install RAS RD Session Host Agent** dialog opens. Follow the instructions and install the agent. When the installation is finished, click **Done** to close the dialog.

10 Back in the wizard, click **Finish** to close it.

If you would like to verify that the RD Session Host server has been added to the farm, click the **Farm** category (below the **Start** category in the left pane of the Parallels RAS Console window) and then click **RD Session Hosts** in the navigation tree (the middle pane). The server should be included in the **RD Session Hosts** list. The **Agent State** column may display a warning message. If it does, reboot the server. The **Agent State** column should now say, "Agent OK", which means that your RD Session Host is functioning properly.

Read on to learn how to publish an application from an RD Session Host server (p. 25).

Publish Applications

Now that you have an RD Session Host server in the farm, you can publish applications from it.

To publish an application:

- 1** In the Parallels RAS Console, select the **Start** category and click the **Publish Applications** item in the right pane.
- 2** The **Publish Applications** wizard opens.
- 3** If you have more than one RD Session Host server, a page will be displayed where you can select one or more servers from which the application should be published. Select one or more servers and click **Next**.
- 4** On the next page, select one or more applications you want to publish.

If you have more than one RD Session Host server and selected more than one server on the previous screen, the **Show applications not available on all target servers** option becomes enabled. If the option is cleared (default), the folder tree will contain applications that are available on each and every server that you selected. If the option is enabled, the tree will contain applications that may be available on some server(s), but not on the others.
- 5** Click **Next**. Review the summary information and click **Next** again.
- 6** Click **Finish** when ready.

To verify that an application has been successfully published, select the **Publishing** category in the RAS Console. The application should be included in the **Published Resources** list (the middle pane).

Invite Users

Your Parallels RAS farm is now fully operational. You have an RD Session Host and published application(s). All you need to do now is invite your users to install the Parallels Client software on their devices and connect to the Parallels RAS farm.

To invite users:

- 1** In the Parallels RAS Console, select the Start category and click the **Invite Users** item.

2 The **Invite Users** wizard opens:

The screenshot shows the 'Startup Wizard - Invite Users' window. The title bar is blue with a question mark and a close button. The main area has a red header with the Parallels logo and a mail icon. Below the header, the text 'Configure the mailbox from where the invitations will be sent from.' is displayed. The 'Mailbox Configuration' section contains several fields: 'Mailbox Server' with an example 'mail.yourcompany.com:500', 'Sender Address', 'TLS / SSL' set to 'Do not use', an unchecked checkbox for 'SMTP server requires authentication', 'Username', and 'Password'. The 'Test Email' section has a text area for email addresses and a 'Send Test Email' button. At the bottom are buttons for '< Back', 'Next >', 'Cancel', and 'Help'.

- 3 Specify the mailbox information that should be used to send invitation emails to users:
- **Mailbox Server:** Enter the mailbox server name. For example, mail.company.com:500
 - **Sender Address:** Enter the email address.
 - **TLS / SSL:** Choose whether to use the TLS/SSL protocol.
 - **SMTP server requires authentication:** Select this option if your SMTP server requires authentication. If it does, also type the username and password in the fields provided.
- 4 In the **Test Email** section, type one or more email addresses to which a test email should be sent (separate multiple address with a semicolon). Click the **Send Test Email** button to send the email.
- 5 Click **Next**.

- 6 On the next page of the wizard, specify target devices and connection options:

Startup Wizard - Invite Users

Parallels®

Specify target devices:

Name

- ☒ Windows
- ☐ Mac
- ☐ HTML5
- ☐ iOS
- ☐ Android
- ☐ ChromeApp
- ☐ Linux

Specify connection options:

Public Gateway IP: 10.124.4.143:80/443 (IP:GW Port/SSL Port) ...

Connection Mode: Gateway Mode

Advanced

< Back Next > Cancel Help

- In the target devices list, select the types of devices to send an invitation to. Each target device of a particular type will receive an email with instructions on how to download, install, and configure the Parallels Client software on that device type.
- In the **Public Gateway IP** field, specify the RAS Secure Client Gateway FQDN or IP address. Please note that this can be a public IP address so it can be reached by a remote user. You can click the [...] button to select a gateway from the list.
- In the **Connection Mode** drop-down list, select the RAS Secure Client Gateway connection mode. Please note that SSL modes require the gateway to have SSL configured. More information can be found in the **Configuring RAS Secure Client Gateway** (p. 126) section.
- Click the **Advanced** button to open the **Advanced Settings** dialog. This dialog allows you to specify a third-party credential provider component. If you use such a component to authenticate your users, specify its GUID in this dialog. For more information, see **Configure Client Policy Options > Single Sign-On** (p. 202).

- 7 Click **Next**.

- 8 On the next page, specify the email recipients. Click the [...] button to select users or groups.

Startup Wizard - Invite Users

Parallels®

Specify the list of recipients:

ras-testing@gmail.com

Review the invitation e-mail:

Dear %RECIPIENT%,

You have been invited by %SENDER% to connect to Parallels Remote Application Server.

%INSTRUCTIONS%

%MANUALINSTRUCTIONS%

Thanks,
System Administrator

Preview Default

< Back Next > Cancel Help

- 9 Review the invitation email template displayed in the **Review the invitation e-mail** box. You can modify the template text as needed. The template also uses variables, which are explained below.
- **%RECIPIENT%** — Specifies the name of a recipient to whom the email message is addressed.
 - **%SENDER%** — The sender's email address that you specified in the first step of this wizard when you configured the outgoing email server settings.
 - **%INSTRUCTIONS%** — Includes a custom URL hyperlink for automatic configuration of Parallels Client. For technical information about the URL, see **Parallels Client URL Scheme** (p. 257).
 - **%MANUALINSTRUCTIONS%** — Includes instructions for manual configuration of Parallels Client.

The variables are defined dynamically depending on the type(s) of the target devices and other settings. Normally, you should always include them in the message, so your users will receive all the necessary instructions and links. To preview the message, click the **Preview** button. This will open the HTML version of the message in a separate window. This is the email message that your users will receive.

- 10** Click **Next**, review the settings that you specified and click **Next** again to send the invitation email to users.

When users receive the invitation email, they will follow the instructions that it contains to install and configure Parallels Client on their devices. Once that's done, the users will be able to connect to Parallels Remote Application Server and launch published resources.

Conclusion

In this tutorial, we have configured a simple Parallels RAS farm with a single RD Session Host and one published application. We then configured a mailbox for outgoing emails and sent an invitation email to end users with instructions on how to install Parallels Client, connect to the Parallels RAS farm, and run the published application. Essentially, we've created a fully functional Parallels RAS farm serving remote applications to end users.

If you wish, you can repeat the tutorial and add more RD Session Host servers, publish more applications, or send an invitation email to users who use different types of devices. The instructions remain essentially the same.

The rest of this guide explains in detail how to configure and use various features of Parallels Remote Application Server.

CHAPTER 4

Parallels RAS Farm and Sites

Parallels RAS farm is a logical grouping of objects for the purpose of centralized management. A farm configuration is stored in a single database which contains information about all objects comprising the farm. A site is the next level grouping in the farm hierarchy which contains servers and other objects providing connection and remote application services.

In This Chapter

Connecting to a Parallels RAS Farm	31
About Sites	32
Viewing Sites in the RAS Console.....	33
Adding a Site to the Farm.....	35
Managing Sites	37
Managing Farm Administrative Accounts	38

Connecting to a Parallels RAS Farm

When you run the Parallels RAS installer and install core Parallels RAS components, you are creating a Parallels RAS farm. If later you install Parallels RAS on another server, you create one more farm. The Parallels RAS Console, which is used to administer a farm, is capable of connecting to any farm that you have in your organization and allow you to administer the farm it is connected to.

When you run the Parallels RAS Console for the first time, you specify the Parallels RAS farm you wish to connect to. We've already talked about this in the **Log In and Activate Parallels RAS** section (p. 18). If you need to connect to a different farm while in the RAS Console, do the following:

- 1 Click on the arrow icon next to your user name in the upper right-hand corner of the RAS Console window and then choose **Log Off** in the context menu.
- 2 After you are logged off, you will see the dialog where you can select a farm you wish to connect to.
- 3 Enter the FQDN or IP address of the server where you have the RAS Publishing Agent installed or click the [...] button for more options. Read below for details.
- 4 Enter the user account name and password to connect to the farm and click **Connect**. Once the connection is established, the Parallels RAS Console will re-appear and will be connected to the specified farm.

Customizing how the Parallels RAS Console connects to a farm

When connecting to a farm (step 3 in the instructions above), you can click the [...] button next to the **Farm** field to define how the Parallels RAS Console connects to a farm. The button opens a dialog, which is described below.

The left pane of the dialog lists known Parallels RAS farms. Select a farm you wish to connect to. If a farm is no longer relevant, you can remove it from the list by clicking the [-] icon above the list.

The right pane of the dialog has the following elements:

Site: Displays the name of the Licensing Site in the selected farm.

Master Publishing Agent: Displays the name of the master RAS Publishing Agent to which the RAS Console connects by default.

Check Connection (button). Click the button to verify that the RAS Console can connect to the specified RAS Publishing Agent.

Alternative Publishing Agents: Lists one or more alternative RAS Publishing Agents. If the master RAS Publishing Agent is not available (for any reason), the RAS Console will try to connect to an alternative Publishing Agent. You can add an alternative Publishing Agent to the list by clicking the [+] icon and then entering its hostname or IP address. The columns in the list are as follows:

- **Publishing Agent.** RAS Publishing Agent hostname or IP address.
- **State.** Indicates whether the RAS Publishing Agent is functioning properly.
- **Site.** Site name to which the RAS Publishing Agent belongs.
- **Priority.** Indicates whether it's a master or secondary RAS Publishing Agent. For more information, see the **RAS Publishing Agents** chapter (p. 163).

Renaming a farm

To change a farm name, select the **Farm** category in the Parallels RAS Console and then select the **Farm** node in the middle pane. Click the **Rename** button in the right pane (next to the **Farm name** field) and enter a new name.

About Sites

A Parallels RAS farm consists of at least one site, but may have as many sites as necessary.

Sites are often used to separate management and/or location functions. For example, by creating a site, you can delegate permissions to a site administrator without granting them full farm permissions. Or you can have separate sites for different physical locations with the ability to copy the same settings to each site while using RD Session Hosts, VDI hosts, or PCs that are closer to end users or (depending on your needs) to back-end servers. For instance, it would make sense for a client/server application querying a database to be published from an RD Session Host which is located closer to the database server.

Each site is completely isolated from other sites within the same farm. The farm simply groups the sites logically and stores configuration properties of each site (and the objects that comprise it) in a single database. Sites don't communicate with each other and don't share any objects or data. The only exception to this rule is the RAS Licensing Site which periodically communicates with other sites to obtain statistics.

Individual object settings in a given site can be replicated to all other sites. This does not mean that settings will be shared between sites. The settings that you choose will simply be applied to other sites. For more information, see the **Managing Sites** section (p. 37).

When you install Parallels Remote Application Server, a farm with a single site is created automatically. This first site becomes the RAS Licensing Site and the host for the main Parallels RAS configuration database. When you add more sites to the farm, the data in this database is automatically synchronized with every site that you add. When changes are applied to a particular site, the main configuration database is automatically updated to reflect the changes.

Each site must have at least the following components installed in order to publish remote applications and desktops for end users:

- Master RAS Publishing Agent
- RAS Secure Client Gateway
- RD Session Host, VDI, or PC

When you install Parallels RAS using default installation options, the master RAS Publishing Agent and the RAS Secure Client Gateway are automatically installed on the server on which you perform the installation. You can then add one or more RD Session Hosts to the site to host published resources. You can also add more sites to the farm if needed and configure individual components for each site as you desire.

Viewing Sites in the RAS Console

To view existing sites, open the Parallels RAS Console and select the **Farm** category in the left pane. Existing sites are listed in the right pane.

Note: The **Farm** node will only be visible to an administrator who has full permissions to manage the farm. For more information about farm/site permissions, please refer to **Managing Farm Administrative Accounts** (p. 38).

The **Farm** category displays the configuration of only one site at a time. If you login as the farm administrator, the configuration of the RAS Licensing Site will be displayed. If you login as an administrator who has access to a specific site (but not the farm), the configuration of that site will be displayed.

Current site

The site which configuration is currently displayed in the console is marked as "Current Site" in the **Type** column. The column also displays other site attributes. For example, "Licensing Site / Local Site / Current Site".

Switching between sites

If you have multiple sites and want to manage a particular one, right-click it in the right pane and choose **Switch to this Site**. The site configuration will be loaded into the RAS Console, so you can see its components and configure them as you require.

You can also switch to a site by clicking **View > Switch Site** in the main menu. This will open the **Change Site** dialog where you can select a desired site.

Renaming the site

To rename a site, select the **Site** in the middle pane and then click the **Rename** button next to the **Site name** field in the right pane. While here, you can also view the site configuration overview, which includes the list of the existing core components. Read more about it below.

Site configuration overview

When you select the **Site** node in the middle pane, the **Site Info** tab page in the right pane displays the list of core Parallels RAS components that have been configured for the site. The components are organized in the list as follows:

- **RD Sessions Hosts**. Lists existing RD Session Hosts servers.
- **VDI Hosts**. Lists existing VDI Host servers.
- **Remote PCs**. Lists existing Remote PCs.
- **Gateways**. Lists existing RAS Secure Client Gateway servers.
- **Publishing Agents**. Lists existing RAS Publishing Agent servers.

To collapse or expand a component group, click an "arrow up" or "arrow down" icon on the right side of the list. Note that if no servers of a particular type have been added to the site, the group name will not be displayed in the list.

The component list includes the following information for each server:

- **Agent.** Indicates whether the agent software is installed on the server and is functioning properly.
- **CPU %.** Current CPU utilization.
- **RAM %.** Current RAM utilization.
- **Sessions.** The number of currently active user sessions.
- **Preferred PA.** The name of the RAS Publishing Agent designated as preferred for this server.
- **Operating System.** Operating system version installed on the server.
- **Agent Version.** The agent version installed on the server.

Opening component editors

The component list described above gives you just an overview. If you would like to open a component editor (where you can configure it), right-click a component (a server) and choose **Show in the Editor** in the context menu. This will take you to the area in the Parallels RAS Console where you can configure servers of this type.

You can also open component editors by selecting a desired component type in the middle pane of the Parallels RAS Console. The list of editors includes:

- **Designer.** Displays a visual representation of the site. Use the icons at the top to add more components to the diagram (if you add a component, it will actually be added to the site). Click Print to print the diagram.
- **RD Session Hosts.** Add, remove, and configure RD Session Host servers.
- **VDI Hosts.** Add, remove, and configure VDI Hosts.
- **Remote PCs.** Add, remove, and configure Remote PCs.
- **Gateways.** Add, remove, and configure RAS Secure Client Gateways.
- **Publishing Agents.** Add, remove, and configure RAS Publishing Agents.
- **HALB.** Configure High Availability Load Balancing.
- **Themes.** Configure themes for the HTML5 client.
- **Settings.** Configure general site settings.

Adding a Site to the Farm

To add a site to the farm:

- 1 In the RAS Console, select the **Farm** category in the left pane and then select the farm in the middle pane.
- 2 In the **Tasks** drop-down menu (the right pane, above the Site list), click **Add** (or click the **+** icon).

- 3** In the **Add Site** dialog:
 - In the **Site** field, specify a site name.
 - In the **Server** field, specify the IP address or FQDN of the server where the Master Publishing Agent and Secure Client Gateway should be installed.
 - Select the **Add an SSL certificate and enable HTML5 Gateway** option to automatically create a self-signed certificate, enable SSL, and enable HTML5 support. For more info, please see **Enable HTML5 Support on the Gateway** (p. 131).
- 4** Click **Next**.
- 5** The **Site Master Properties** dialog opens. First, it verifies if RAS Publishing Agent is installed on the specified site server. If it isn't, it will indicate this in the **Status** field.
- 6** Click the **Install** button to install the agent.
- 7** In the **Install RAS Publishing Agent** dialog, highlight the server name on which the RAS Publishing Agent is to be installed.
- 8** (Optional) Select the option **Override system credentials** to specify and use different credentials to connect to the server and install the agent.
- 9** Click **Install** to install the publishing agent and gateway. Click **Done** once it has been successfully installed.

Once a new site is created, you can view and manage its configuration by right-clicking the site in the RAS Console and choosing **Switch to this Site**.

Managing Sites

Replicating Site Settings to all Sites

Site-specific settings configured for a given site can be replicated to all other sites in a farm. Refer to the table below for the information about which settings can be replicated to other sites.

Category	Section	Options
Farm	VDI Hosts, Persistent Guests	Auto removal timeout
Farm	Settings, Auditing	All Settings
Farm	Settings, Global Logging	Logging Settings
Farm	URL Redirection	All Settings
Load Balancing	Load Balancing	All Settings
Publishing	Advanced, Shortcuts	All Settings
Publishing	Advanced, Extensions	All Settings
Publishing	Advanced, Licensing	All Settings
Publishing	Advanced, Display	All Settings
Publishing	Filtering, User	All Settings
Publishing	Filtering, Client	All Settings
Publishing	Filtering, IP Address	All Settings
Publishing	Filtering, MAC	All Settings
Universal Printing	Universal Printing	Printer Renaming
Universal Printing	Font Management	All Settings
Universal Scanning	Scanning Applications	All Settings
Connection	Authentication	All Settings
Connection	Second Level Authentication	All Settings
Connection	Allowed Devices	All Settings
Reporting	Reporting Engine	Reporting Engine Type
Reporting	Engine specific settings	All Settings

To replicate site settings to all other sites, select **Farm / Site / Settings** and then select the **Replicate settings** option (at the bottom of the **Auditing** tab page). Please note that this option is disabled if you have just one site in the farm.

Overriding Site Replicated Settings

If an administrator who has permissions to enable or disable replication settings makes a change to a specific setting, such setting is replicated to all other sites.

If an administrator has access to a particular site only, upon modifying site settings which have been replicated, the replicated settings are overridden and the option **Replicate Settings** is automatically cleared, therefore such settings will no longer be replicated to other sites.

Setting a Site as the Licensing Site

If you would like to set a different site as the Licensing Site, click on the site name in the **Farm** node and then click **Set Site as Licensing Site** in the **Tasks** drop-down menu.

Managing Farm Administrative Accounts

You can have more than one Parallels RAS administrator who can manage the farm and the sites. If needed, you can configure permissions for a specific administrator to limit access to individual categories and sites.

If Parallels RAS is installed in an Active Directory environment, any user that has elevated privileges and write access to the installation directory can be configured as a Parallels Remote Application Server administrator.

If the Parallels Remote Application Server is installed on a standalone machine, any user that has elevated privileges and write access to the installation directory can be configured as a Parallels Remote Application Server administrator.

When creating an administrative account in Parallels RAS, you can select an individual user account or an account group.

Default Parallels RAS Administrator

The user you specified when you logged into the Parallels RAS Console for the first time is automatically granted full permissions and can perform any task in the farm. There must be at least one enabled administrator with full permissions in the farm.

Adding an Administrator Account

To add an administrator account to the Parallels RAS farm:

- 1 In the RAS Console, select the **Administration** category and then click the **Accounts** tab in the right pane.
- 2 Click the **Tasks** drop-down menu and choose **Add** (or click the **[+]** icon).
- 3 The **Administrator Properties** dialog opens.
- 4 Click the **[...]** button next to the **Name** field. In the **Select User or Group** dialog, select a user or a group.
- 5 Specify an email address and the mobile phone number. Both fields are optional and are disabled if the account specified in the **Name** field is a group.

- 6 The **Permissions** field allows you to configure permissions for this user. By default, the **Full Permissions** option is selected. To grant specific permissions, click the **Change Permissions** button. For further instructions, please read the **Configuring Administrator Accounts Permissions** section (p. 39).
- 7 In the **Receive system notifications via** drop-down list, select **Email**, so any system notifications are sent to the specified email address. Select **None** to disable email system notifications for this account.
- 8 Click **OK** to add the new administrator account to the farm.

Configuring Administrator Accounts Permissions

To configure permissions for an administrator account:

- When creating a new account, click the **Change Permissions** button in the **Administrator Properties** dialog.
- To configure permissions for an existing account, right-click it on the **Accounts** tab page and choose **Properties**.

Use the **Account permissions** dialog to configure permissions. Permissions can be assigned per category (e.g. Farm, Publishing, Universal Printing, etc.) and also per site.

In the **Account permissions** dialog, select the **Full Permissions** option (default) to enable the administrator to modify all categories, sites, and global settings in the farm.

To set specific permissions:

- 1 Clear the **Full Permissions** option.
- 2 In the **In Site** list (on the right), select one or more sites to which these permissions should apply.
- 3 Select (or clear) the following options to set permissions:
 - **Allow viewing of Site information.** Can view (but not necessarily modify) site information.
 - **Allow Site changes.** Can modify the following categories: **Site**, **Load Balancing**, **Universal Printing**, **Universal Scanning**. This option is disabled if the **Allow viewing of Site information** option is cleared.
 - **Allow Session Management.** Can manage running sessions. This option is disabled if the **Allow viewing of Site information** option is cleared.
 - **Allow Publishing changes.** Can modify the **Publishing** category.
 - **Allow Connection changes.** Can modify the **Connection** category.
 - **Allow viewing of RAS Reporting.** Can view reports generated by the RAS Reporting engine.
 - **Allow Client Management changes.** Can modify the **Client Manager** category.

- 4 **Allow Policies changes.** Enable this option to allow the administrator to modify the **Policies** category.
- 5 **Allow access to Information.** Enable this option to allow the administrator to access the **Information** category.

Enabling or disabling an administrator account

To enable or disable a Parallels RAS administrator account, select or clear the checkbox in front of the account name. You can also enable or disable an account in the **Administrator Properties** dialog by selecting or clearing the **Enable account** option (to open the dialog, right-click an account and choose **Properties**).

A disabled account cannot be used to log in to the RAS Console. If it's a group, the members of that group will not be able to log in to the Parallels RAS Console either.

Managing Administrator Accounts

To view existing administrator accounts, select the **Administration** category in the RAS Console. The **Accounts** tab page lists existing accounts and their properties, including:

- **Group or user name.** Account name, which can be a user or group name.
- **Type.** Account type. Can be one of the following: **User**, **Group**, **Group User**. The **User** and **Group** are self-explanatory. The **Group User** is a user who receives Parallels RAS administrative permissions via a group membership. When you initially add a group to the list of Parallels RAS administrators, its members are not displayed on the **Accounts** tab page. As soon as a member of the group logs in to Parallels RAS, the account name is added to the list of administrators as a **Group User** and remains there. Note that you cannot change Parallels RAS permissions for such an account individually outside the group permissions.
- **Permissions.** Parallels RAS permissions granted to the account. Can be one of the following: **Full Permissions**, **Custom Permissions** (when more than one permission type is granted, but not all), or a particular permission type if a single one was granted.
- **Email.** Email address.
- **Mobile.** Mobile phone number.
- **Group.** Group name. This column has a value for Group Users only (see the **Type** column description above).
- **Last Modification By.** The name of the user who modified this account in Parallels RAS the last time.
- **Changed On.** The last account modification date.
- **Created By.** The name of the user who created this account in Parallels RAS.
- **Created On.** The date when this account was added to Parallels RAS.

Modifying an account

To modify an account:

- 1 Right-click an account and choose **Properties** in the context menu.
- 2 Use the **Administrator Properties** dialog to modify the necessary information. For more info, see **Adding an Administrator Account** (p. 38).

Handling Locked Categories

When an administrator is accessing a category in the Parallels RAS Console (e.g. Farm, Publishing, Universal Printing, etc.), the category is locked for all other administrators. Therefore, upon trying to access a locked category, an administrator will be alerted with an error that the object is locked. You can release the lock as follows:

- 1 On the **Administration > Accounts** tab page, click the **Tasks** drop-down menu and choose **Show Sessions**.
- 2 In the **Sessions** dialog, select the administrator who is locking a category and then click the **Send Message** icon (at the top).
- 3 If the administrator doesn't reply and doesn't release the category, you have an option to click **Log Off**, which will log them off and will unlock the category.

Using Instant Messaging for Administrators

Parallels RAS administrators logged on to the same farm can communicate with each other using a built-in instant messenger.

To use the instant messenger:

- 1 In the RAS Console, select the **Administration** category.
- 2 Expand the drop-down menu next to your name (top-right corner of the console screen) and click **Chat**.
- 3 The **Parallels Remote Application Server Chat** window opens.

To send a message:

- 1 Type the message text in the lower input panel.
- 2 In the **Logged on administrators** list box, select a specific administrator or **All** to send the message to an individual or all logged on administrators.
- 3 Click **Send**.

Your message history is displayed in the **Messages** panel. To clear the history, click **Clear All**.

You can also view the chat history listing all messages between all administrators (not just your own messages). To do so, select the **Administration** node in the console and then select the **Chat History** tab page.

Joining Customer Experience Program

Parallels Customer Experience Program helps us to improve the quality and reliability of Parallels Remote Applications Server. If you accept to join the program, we will collect information about the way you use Parallels Remote Application Server. We will not collect any personal data, like your name, address, phone number, or keyboard input.

To join the program:

- 1** In the RAS Console, select the **Administration** category.
- 2** In the right pane, click the **Settings** tab.
- 3** Select the **Participate in the Customer Experience Program** option.

After you join the program, CEP will automatically start to collect information about how you use Parallels Remote Application Server. Data collected from you and other participants is combined and thoroughly analyzed to help us improve Parallels Remote Application Server.

CHAPTER 5

RD Session Hosts

RD Session Host servers are used to publish resources (applications, desktops, documents, etc.) to Parallels RAS users. Read this chapter to learn how to add, configure, and administer RD Session Host servers.

In This Chapter

Viewing RD Session Host Servers	43
Adding an RD Session Host Server	44
Configuring an RD Session Host	47
Grouping RD Session Hosts	53
Using Scheduler	53
Managing Sessions	55
Managing Logons.....	57
Publishing from an RD Session Host	58
Publishing Containerized Applications	63
Viewing Published Resources Hosted by RD Session Hosts.....	66

Viewing RD Session Host Servers

To view the list of RD Session Host servers for the current site:

- 1 In the RAS Console, navigate to **Farm** / <site-name> / **RD Session Hosts**.
- 2 The available RD Session Hosts are displayed on the **RD Session Hosts** tab page in the right pane.

You can filter the **RD Session Hosts** list as follows:

- 1 Click the magnifying glass icon, which is located on a toolbar above the list.
- 2 An extra row is displayed at the top of the list where you can type a string in one or more columns that will be used to filter the list.
- 3 For example, if you want to search for a server by its name, enter the text in the **Server** column. You can type the entire server name or the first few characters until a match is found. The list will be filtered as you type and only the matching server(s) will be displayed.
- 4 If you type a filter string in more than one column, they will be combined using the logical AND operator.
- 5 To remove the filter and display the complete list, click the magnifying glass icon again.

- 6 If you click the magnifying glass icon one more time, you'll see that the filter that you specified earlier is still there. To remove it completely, simply delete the filter string(s) from the column(s).

Viewing RD Session Host summary

In addition to the RD Session Hosts editor described above, you can also see the summary about the available RD Session Host servers. To do so:

- 1 In the RAS Console, select the **Farm** category and then select the **Site** node in the middle pane.
- 2 The available servers are displayed in the **RD Session Hosts** group in the right pane.
- 3 To go to the RD Session Host editor (described above), right-click a server and choose **Show in the Editor**.

For additional info, see **Viewing Sites in the RAS Console** (p. 33).

Adding an RD Session Host Server

RD Session Host server requirements

An RD Session Host server must have the Remote Desktop Services (RDS) role installed. RDS was known as Terminal Services prior to Windows 2008 R2. On some older versions of Windows Server, Terminal Services are not installed by default. If you are using such a server, you can install RDS right from the RAS Console, as described later in this section.

To push install the RAS RD Session Host Agent on a server, the following requirements must be met:

- The firewall must be configured on the server to allow push installation. Standard SMB ports (139 and 445) need to be open. See also **Port Reference** (p. 252) for the list of ports used by Parallels RAS.
- SMB access. The administrative share (\\server\\c\$) must be accessible. Simple file sharing must be enabled.
- Your Parallels RAS administrator account must have permissions to perform a remote installation on the server. If it doesn't, you'll be asked to enter credentials of an account that does.
- The RD Session Host server should be joined to an AD domain. If it's not, the push installation may not work and you will have to install the Agent on the server manually. See **Installing the Agent manually** section (p. 46).

Quickly add an RD Session Host

You can quickly add an RD Session Host server to a site from the **Start** category in the RAS Console. This process is described in the **Setting Up a Basic Parallels RAS Farm** section (p. 23).

The rest of this section describes how to add an RD Session Host server from the **Farm** category. Compared to using the **Start** category, this process consists of more steps but gives you more options.

Discover RD Session Hosts on your network

Before adding RD Session Hosts, you can search for servers in your Active Directory domain that meet the necessary Parallels RAS requirements (see **System Requirements**).

To search for servers:

- 1 In the RAS Console, navigate to **Farm \ Site \ RD Session Hosts**.
- 2 On the **RD Session Hosts** tab page, click **Tasks > Discover RD session hosts**.
- 3 The **Find Servers** dialog opens and begins searching for suitable servers. If no servers are found, you can add a server manually (jump to the **Adding an RD Session Host Manually** subsection below).
- 4 If at least one suitable server is found, it will be displayed in the **Find Servers** dialog.
- 5 Select a server and verify whether the RAS RD Session Host Agent is installed on it by looking at the **Agent** column. If the agent is not installed, click the **Install Agent** button and follow the instructions.
- 6 Click **OK**.
- 7 On the **RD Session Hosts** tab page in the RAS Console, verify that the RD Session Host is enabled (the checkbox in front of the server name is selected). If it's not, select the checkbox.

Adding an RD Session Host manually

To add an RD Session Host manually:

- 1 Click **Add** in the **Tasks** drop-down menu.
- 2 In the **Add RD Session Host** dialog, specify the following options:
 - **Server**. Specify the server IP address or FQDN.
 - **Add Firewall Rules**. Automatically configure the firewall on the server to meet Parallels RAS requirements. See **Port Reference** (p. 252) for the list of ports used by Parallels RAS.
 - **Install RDS role**. Install the RDS role in Windows running on the server.
 - **Enable Desktop Experience**. Enable the Desktop Experience feature in Windows running on the server. This option is enabled only if the **Install RDS role** option (above) is selected. The option applies to Windows Server 2008 R1/R2 and Windows 2012 R1/R2 on which the Desktop Experience feature is not enabled by default.
 - **Restart server if required**. Restart the server if necessary. Please note that this option is ignored if a restart is pending on a local machine (i.e. the restart of a local machine will not be forced).

- **Specify users or groups to be added to the Remote Desktop Users group.** This option allows you to add Parallels RAS users or groups to the Remote Desktop Users group in Windows running on the server. This is necessary for your Parallels RAS users to be able to access published resources hosted by an RD Session Host. If a Parallels RAS user is not a member of the Remote Desktop Users group on a given RD Session Host, they will be denied access to its published resources. Select this option and then use the **[+]** icon below it to specify users or groups.
- 3** Click **Next**.
 - 4** In the next step, a checking is performed if the RAS RD Session Host Agent is installed on the server.
If the agent is not installed:
 - a** Click **Install** to push install the agent.
 - b** In the **Installing RD Session Host Agent** dialog, select the target server.
 - c** (Optional) Select the **Override system credentials** option to specify different credentials to connect to the server. You need to do this if the RAS admin account that you are using doesn't have permissions to perform a remote installation on the target server.
 - d** Click **Install** to install the agent. Click **Done** once the agent is installed. If the push installation of the RAS RD Session Host Agent fails for any reason, you have an option to install it manually. Please see **Installing the Agent Manually** (p. 46).
 - 5** In the **Agent Information** dialog, click **Add** to add the RD Session Host to the Parallels RAS farm.
 - 6** Click **Apply** in the Parallels RAS Console to commit the new settings.

Installing the Agent Manually

You may need to install the RAS RD Session Host Agent manually if the automatic push installation cannot be performed. For instance, an SMB share may not be available or the firewall rules may interfere with the push installation, etc.

Installing RAS RD Session Host Agent Manually

- 1** Log in to the server where the RAS RD Session Host Agent is to be installed using an administrator account and close all other applications.
- 2** Copy the Parallels Remote Application Server installation file (**RASInstaller.msi**) to the server and double-click it to launch the installation.
- 3** Once prompted, click **Next** and accept the End-User license agreement.
- 4** Specify the path where the RAS RD Session Host Agent should be installed and click **Next**.
- 5** Select **Custom** and click **Next**.
- 6** Click on **RAS RD Session Host Agent** and select **Entire Feature will be installed on local hard drive** from the drop-down menu.

- 7 Ensure that all other components are deselected and click **Next**.
- 8 Click **Install** to start the installation.
- 9 Click **Finish** once the installation is finished.

The RAS RD Session Host Agent doesn't require any configuration. Once the agent is installed, highlight the server name in the Parallels RAS Console and click **Troubleshooting > Check Agent** in the **Tasks** drop-down menu to update the server status.

Uninstalling RAS RD Session Host Agent

To uninstall RAS RD Session Host Agent from a server:

- 1 Navigate to **Start > Control Panel > Programs > Uninstall a Program**.
- 2 Find **Parallels Remote Application Server** in the list of installed programs.
- 3 If you don't have any other Parallels RAS components on the server that you want to keep, right-click **Parallels Remote Application Server** and then click **Uninstall**. Follow the instructions to uninstall the program. You may skip the steps below.
- 4 If you have other RAS components that you want to keep on the server, right-click **Parallels Remote Application Server** and then click **Change**.
- 5 Click **Next** on the Welcome page.
- 6 On the **Change, repair, or remove** page, select **Change**.
- 7 On the next page, select **Custom**.
- 8 Select **RAS RD Session Host Agent**, then click the drop-down menu in front of it, and click **Entire feature will be unavailable**.
- 9 Click **Next** and complete the wizard.

Configuring an RD Session Host

This section describes how to configure and manage an existing RD Session Host server.

Read on to learn how to:

- Check RAS RD Session Host Agent Status (p. 48)
- Change an RD Session Host Site Assignment (p. 48)
- View and Modify RD Session Host Properties (p. 48)

Check RAS RD Session Host Agent Status

An RD Session Host server must have RAS RD Session Host Agent installed in order to publish remote applications and desktop from it. In addition to this, Remote Desktop Services (formerly Terminal Services) must be installed on it.

Normally, when you add an RD Session Host to a site, the RD Session Host Agent and Remote Desktop Services are installed by default. However, if you skipped the installation (or uninstalled the agent or RDS from the server), you can check their status and take appropriate actions if needed. To do so:

- 1 First, check the **Agent State** column in the **RD session hosts** list. The column should contain the "Agent OK" value. If so, the agent is installed and functioning properly. If not, read on.
- 2 Right-click a server and choose **Troubleshooting > Check Agent** in the context menu. The **Agent Information** dialog opens.
- 3 If the agent is not installed on the server, click the **Install** button and follow the instructions on the screen.
- 4 To install RDS, right-click the server and choose **Control > Install Terminal Services**.

After the agent and RDS installation is complete, you may need to reboot the RD Session Host server. You can do it right from the Parallels RAS Console by right-clicking the server and choosing **Control > Reboot**.

Change RD Session Host Site Assignment

You can assign an RD Session Host to a different site in your farm if needed. Please note that this functionality is only available if you have more than one site in your farm.

To change the site assignment:

- 1 Right-click an RD Session Host and then click **Change Site** in the context menu. The **Change Site** dialog opens.
- 2 Select a site in the list and click **OK**. The server will be moved to the **RD Session Hosts** list of the target site (**Farm / <new-site-name> / RD Session Hosts**).

View and Modify RD Session Host Properties

To configure an RD Session Host server:

- 1 In the RAS Console, navigate to **Farm / Site / RD Session Hosts**.
- 2 Right-click a server and click **Properties** in the context menu.

3 The **Server Properties** dialog opens where you can configure the RD Session Host server:

Properties

Select or clear the **Enable Server in site** option to enable or disable a server. By default, a server is enabled. A disabled server cannot serve published applications and virtual desktops to clients.

Other elements on this page are:

- **Server:** Specifies the server name.
- **Description:** Specifies the server description.
- **Change Direct Address:** Select this option if you need to change the direct address that Parallels Client uses to establish a direct connection with the RD Session Host.

Agent Settings

Each RD Session Host in the farm has an RAS RD Session Host Agent installed through which it communicates with other Parallels RAS components. Use the **Agent Settings** tab page to configure the agent.

To use default settings, select the **Inherit default settings** option. To view or modify the default settings, click the **Edit Defaults** link.

If you want to specify custom settings for a given server, clear the **Inherit default settings** option and specify agent properties as follows:

- **Port.** Specifies a different remote desktop connection port number if a non-default port is configured on the server.
- **Max Sessions.** Specifies the maximum number of sessions.
- **Publishing Session Disconnect Timeout.** Specifies the amount of time each session remains connected in the background after the user has closed the published application. This option is used to avoid unnecessary reconnections with the server.
- **Publishing Session Reset Timeout.** This feature allows you to control how long it takes for a session to be logged off after it is marked as "disconnected".
- **Allow Client URL/Mail Redirection.** Select this option to allow http and mailto links to be opened using a local application on the client computer rather than the server's resources. To configure a list of URLs which should not be redirected, navigate to the **URL Redirection** tab in the **Settings** node of a site.
- **Preferred Publishing Agent.** Select a Publishing Agent to which the RD Session Host should connect. This is helpful when site components are installed in multiple physical locations communicating through WAN. You can decrease network traffic by specifying a more appropriate Publishing Agent.
- **Allow 2XRemoteExec to send command to the client.** Select this option to allow a process running on the server to instruct the client to deploy an application on the client side. More about 2XRemoteExec in the **Using RemoteExec** subsection below.
- **Enable applications monitoring.** Enable or disable monitoring of applications on the server. Disabling application monitoring stops the WMI monitoring to reduce CPU usage on the server and network usage while transferring the information to RAS Publishing Agent. If the option is enabled, the collected information will appear in a corresponding RAS report. If the option is disabled, the information from this server will be absent from a report.
- **Use RemoteApps if available.** Enable this option to allow use of remote apps for shell-related issues when an app is not displayed correctly. This feature is supported on the Parallels Client for Windows only.
- **Allow file transfer command.** Allows you to enable or disable the remote file transfer functionality. For more information, see **Enabling or Disabling Remote File Transfer** (p. 206).
- **Allow local to remote drag and drop.** Enables the drag and drop functionality in a remote application. When this option is enabled, users can drag and drop files to a remote application on their local devices. For example, a user can drag and drop a file to the Acrobat reader to open a PDF file. Or the user can drag and drop a file to Windows Explorer, which runs remotely, etc.

Note: At the time of this writing, the drag and drop functionality is only supported on Parallels Client for Windows and Parallels Client for Mac.

Using 2XRemoteExec

2XRemoteExec is a feature that facilitates the servers ability to send commands to the client. This is done using the command line utility `2XRemoteExec.exe`. Command line options include:

Command Line Parameter	Parameter Description
-s	Used to run the 2XRemoteExec command in 'silent' mode. Without this parameter, the command will display pop up messages from the application. If you include the parameter, the messages will not be displayed.
-t	Is used to specify the timeout until the application is started. Timeout must be a value between 5000ms and 30000ms. Note that the value inserted is in 'ms'. If the timeout expires the command returns with an error. Please note that the application might still be started on the client.
-?	Shows a help list of the parameters that 2XRemoteExec uses.
"Path for Remote Application"	The Application that will be started on the client as prompted from the server.

2XRemoteExec examples:

The following command displays a message box describing the parameters that can be used.

```
2XRemoteExec -?
```

This command runs Notepad on the client.

```
2XRemoteExec C:\Windows\System32\Notepad.exe
```

In this example, the command opens the `C:\readme.txt` file in the Notepad on the client. No message is shown and 2XRemoteExec would wait for 6 seconds or until the application is started.

```
2XRemoteExec C:\Windows\System32\Notepad.exe "C:\readme.txt"
```

User Profile Disks

User profile disks are virtual hard disks that store user application data on a dedicated file share. This disk is mounted to the user session as soon as the user signs in to the RD Session Host server, and unmounted when the user logs out.

To use the default user profile disks settings, select the **Inherit default settings** option. To view or modify the default settings, click the **Edit Defaults** link. The **Default Server Properties** dialog has the same design as the **Server Properties** dialog. You can use the instructions below to modify both the default and an individual server properties.

To configure user profile disks for a given RD Session Host server, clear the **Inherit default settings** option and specify the options described below.

Enable or disable user profile disks: Use the drop-down list box to specify whether to enable or disable user profile disks on the server. Select from the following options:

- **Do not change.** Keep the current server settings (default).

- **Enabled.** Enable user profile disks.
- **Disabled.** Disable user profile disks.

Disk location: In the text field provided, specify a network location where user profile disks should be created. Use the Microsoft Windows UNC format to specify a location (e.g. \\RAS\users\disks). Please note that the server must have full control permissions on the disk share.

Maximum size: Enter the maximum allowed disk size (in gigabytes).

User profile disks data settings: Click this button to open the **User Profile Disks Data Settings** dialog. In the dialog, you can specify which user folders should be stored on the user profile disk. Select one of the following:

- **Store all user settings and data on the user profile disk.** All folders, except those specified in the exclusion list, will be stored on the user profile disk. To add or remove folders to/from the exclusion list, click the **[+]** or **[-]** buttons.
- **Store only the following folders on the user profile disk.** Only folders specified in the inclusion lists will be stored on the user profile disk. There are two inclusion lists. The first one contains standard user profile folders (e.g. Desktop, Documents, Downloads, etc.) and allows you to select the folders that you want to include. The second list (below the first list) allows you to specify additional folders. Click the **[+]** or **[-]** buttons to add or remove folders.

Desktop Access

The **Desktop Access** tab page allows you to restrict remote desktop access to certain users.

By default, all users who have access to remote applications on an RD Session Host can also connect to the server via a standard RDP connection. If you want to restrict remote desktop access to certain users, do the following:

- 1 On the **Desktop Access** tab page, select the **Restrict direct desktop access to the following users** option. If you have the **Inherit default settings** option selected, click the **Edit Defaults** link to see (and modify if needed) the default configuration. The rest of the steps apply to both the **Server Properties** and **Default Server Properties** dialogs.
- 2 Click the **Add** button.
- 3 Select the desired users. To include multiple users, separate them by a semicolon.
- 4 Click **OK**.
- 5 The selected users will appear in the list on the **Desktop Access** tab page.

Users in this list will still be able to access remote applications using Parallels Client, but will be denied direct remote desktop access to this server.

Note: Computer Configuration / Administrative Templates / Windows Components / Remote Desktop Services / Remote Desktop Session Host / Connection / Allow users to connect remotely using remote desktop services must be set to **Not configured**, otherwise it takes precedence.

Please note that members of the Administrator group will still be able to connect to the remote desktop even if they are included in this list.

RDP Printer

The **RDP Printer** tab page allows you to configure the renaming format of redirected printers. The format may vary depending on which version and language of the server you are using.

To use default RDP printer settings, select the **Inherit default settings** option. To view or modify the default options, click the **Edit Defaults** link.

The **RDP Printer Name Format** drop-down list allows you to select a printer name format specifically for the configured server.

Select the **Remove session number from printer name** and the **Remove client name from printer name** options to exclude the corresponding information from the printer name.

Grouping RD Session Hosts

RD Session Host groups can be used to specify from which group a published resource should be published when using the Publishing wizard. It is highly recommended to use groups in a multi-server environment to ease the management of published resources.

After you create a group and publish resources from it, you can view the list of resources by right-clicking a group and choosing **Show published resources** (or click **Tasks > Show Published Resources**). For more information, see **Viewing Published Resources Hosted by RD Session Hosts** (p. 66).

To create or modify an RD Session Host group:

- 1 With **Farm > RD Session Hosts** selected in the navigation tree, click the **Groups** tab.
- 2 To create a new group, click the **Tasks** drop-down menu and choose **New Group** (or click the **[+]** icon). To modify an existing group, right-click it and then choose **Properties** in the context menu.
- 3 In the **Group Properties** dialog, specify the group name and select servers to add to the group.
- 4 Click **OK** to create or save (if modifying) the group.

Using Scheduler

The **Scheduler** tab page in the **RD Session Hosts** view allows you to reboot or temporarily disable servers according to a schedule.

To create a new scheduler task or modify an existing one:

- 1 In the RAS Console, navigate to **Farm** / <server-name> / **RD Session Hosts**.
- 2 In the right pane, click the **Scheduler** tab.
- 3 To create a new task, click **Add** in the **Tasks** drop-down menu and select a desired task from the following options:

- **Disable Server**
- **Disable Server Group**
- **Reboot Server**
- **Reboot Server Group**

To modify an existing task, right-click it and select **Properties** in the context menu. To delete a task, right-click it and select **Delete**.

- 4 The schedule properties dialog will have slightly different options depending on the task type that you choose in the **Tasks** > **Add** drop-down menu. The differences are described in the following steps.
- 5 Select **Enable Schedule** to enable the task.
- 6 Specify the task name, target server (or server group if you've selected a group task), and an optional description.
- 7 Specify the start date and time, duration, and the scope (the **Repeat** property). If you select **Never** in the **Repeat** drop-down box, the task will run only once.
- 8 The **Notify Users Message** box allows you to type a message that will be sent to the users before the task is executed (you can select the time period using the **Send message [] before action is triggered** drop-down list).
- 9 The **Options** section will have different options depending on the task type:
 - If a task is **Disable Server** or **Disable Server Group**, the available option is **On Disable**. You can use it to specify how the active session states should be handled.
 - If a task is **Reboot Server** or **Reboot Server Group**, the available options are **Enable Drain Mode** and **Force Server Reboot After** (the options work together). If you enable the drain mode, the following will happen. When the task triggers, new connections to a server will be refused but active connections will continue to run. A server will be rebooted when all active users end their sessions or when it's time to force reboot it, whichever comes first. For active users not to lose their work, specify a message in the **Notify Users Message** box advising them to save their work and log off. Please also see the **RD Session Host Drain Mode Examples** subsection below.
- 10 Click **OK** to save the changes and close the dialog.

RD Session Host Drain Mode Examples

Example 1: Scheduling a server group for reboot without the drain mode

A server group contains 3 servers: A, B, C

- Date: 7/24/2015
- Start Time: 10:45am
- Send Message: 2 minutes before

Users with active sessions are notified 2 minutes before the server rebooting task is triggered.

Example 2: Scheduling a server group for reboot with the drain mode enabled

A server group containing 3 servers: A, B, C

- Date: 7/24/2015
- Start Time: 10:45am
- Drain mode: enabled
- Force reboot after: 3 hours
- Send Message: 2 minutes before

The session users are notified 2 minutes before the server rebooting task is triggered.

When the task is triggered:

- 1 The drain mode is enabled on the servers.
- 2 Server A and B have no active or disconnected sessions, so they are restarted immediately.
- 3 Server C still has open/disconnected sessions, so it continues to run until all users end their sessions. If the server still has active sessions in three hours, the sessions are terminated and the server is restarted.

Managing Sessions

The **Sessions** tab page allows you to view and manage current sessions for RD Session Host servers. To view the page, navigate to **Farm / Site / RD Session Hosts / Sessions**.

Note: You can also open the **Sessions** tab page by right-clicking a server on the **RD Session Hosts** tab page and choosing **Show Sessions**. This will open the **Sessions** tab page with a filter applied to it to display only the sessions that belong to the selected server.

The **Sessions** lists displays current sessions and includes the following info for each session:

- **Server.** RD Session Host server name.
- **Session ID.** Session ID.
- **User.** Session owner.

- **Protocol.** Protocol used: **Console** (Parallels RAS Console connection), **RDP** (remote user connected via RDP).
- **State.** Session state: **Idle**, **Active**, **Disconnected**.
- **Logon Time.** Last date and time the user logged on.
- **Session Length.** Total sessions duration.
- **Idle Time.** Total session idle time.
- **Type.** Session type: **Admin**, **Published Application**, **Published Desktop**.
- **Resolution.** Client display resolution.
- **Color Depth.** Client display color depth.
- **Device Name.** Client device name.
- **IP Address.** Client IP address.

You can sort the **Sessions** list by any session property. Simply click on a desired column heading to sort the list in ascending or descending order.

You can also filter the list using a single or multiple session properties as a criteria. To do so, click the magnifying glass icon (top right) and then type a desired string in a desired column. The list will be filtered as you type.

To manage a session (or multiple sessions at the same time), select one or more sessions and then use the **Tasks** drop-down menu to choose from the following actions:

- **Refresh.** Refresh the list.
- **Disconnect.** Disconnect the selected session(s).
- **Log Off.** Log off the session(s).
- **Send Message.** Opens the **Send Message** dialog where you can type and send a message to the session owner(s).
- **Remote Control.** Remotely control the selected user session.
- **Show Running Processes.** Display and manage running processes. See below for details.

Managing running processes

The **Tasks > Show running processes** option opens the **Running Processes** dialog where you can view running processes for one or more RD Session Host servers.

Note: You can also open the **Running Processes** dialog by right-clicking a server on the **RD Session Hosts** tab page and choosing **Show Processes**. This will open the **Running Processes** dialog with a filter applied to it to display only the processes that belong to the selected server.

On the **Running Processes** dialog, use the **Show processes from** drop-down menu to filter the list using the following options:

- **Selected Session.** Displays processes for the session selected in the **Sessions** list.
- **Selected Server.** Displays all running processes for the server on which the selected session is running.
- **All Servers.** Displays all running processes for all available servers.

You can also filter the list by specifying a search criteria for one or more columns. To do so, click the magnifying glass icon (top right) and then type a desired text in one or more columns. The list is filtered as you type to match the specified criteria.

The **Tasks** drop-down menu in the **Running Processes** dialog includes the following options:

- **Refresh.** Refresh the list.
- **Kill process.** Kill the selected process.
- **Go To Published Item.** Enabled when you select a process that belongs to a running published resource. Brings up the main Parallels RAS Console window and navigates to the corresponding published resource.
- **Disconnect.** Disconnect the session.
- **Log off.** Log off the session.
- **Send message.** Send a message to the session owner.
- **Remote control.** Remotely control the selected user session.

Managing Logons

The logon management feature allows you to enable or disable logons from RD Session Hosts. The feature performs the same tasks as the **change logon** command-line utility.

To manage logons:

- 1 In the Parallels Remote Application Server Console, navigate to **Farm / Site / RD Session Hosts**.
- 2 Select an RD Session Host, click **Tasks > Control** and choose one of the following:
 - **Enable logons** — enables logons. This option performs the same action as the **change logon /enable** command.
 - **Disable logons and reconnections** — disables subsequent logons. Does not affect currently logged on users. This option performs the same action as **change logon /disable** command.
 - **Disable logons until server reboot** — disables logons until the computer is restarted, but allows reconnections to existing sessions. Same action as the **change logon /drainuntilrestart** command.

To see the current logon control mode for an RD Session Host, right-click it and point to **Control** in the context menu. The checked-out option indicates the current logon control mode of the selected RD Session Host. To do this check from the command line, execute the `change logon /QUERY` command on the server.

Please also note the following:

- When applying a logon control mode on a server, ensure that the agent state is updated accordingly.
- You must set the logon control options for the servers one-by-one. If you need to do it for a group of servers, you can use the scheduler (see **Using an RD Session Host Scheduler** (p. 53)).
- There's no option for disabling logons from new client sessions but allowing reconnections to existing sessions (`change logon /DRAIN`) because its behavior is identical to the **Disable logons until server restart option** (`change logon /DRAINUNTILRESTART`).
- **Computer Configuration / Administrative Templates / Windows Components / Remote Desktop Services / Remote Desktop Session Host / Connection / Allow users to connect remotely using remote desktop services** must be set to **Not configured**, otherwise it takes precedence.

Publishing from an RD Session Host

This section describes how to publish resources hosted by an RD Session Host. The publishing functionality described here is accessed from the **Publishing** category in the RAS Console.

You can also publish resources using a publishing wizard in the **Start** category, as described in the **Setting Up a Simple RAS Environment** section (p. 23). The **Start** category publishing wizard is a simplified version that gives you convenient options of selecting the resources that you want to publish. You may try both approaches and choose the one that better suits your needs.

Read on to learn how to publish resources from an RD Session Host.

Publishing a Desktop from an RD Session Host

To publish a remote desktop from an RD Session Host:

- 1 In the RAS Console, select the **Publishing** category and click the **Add** icon below the **Published Resources** tree. This will launch the publishing wizard.
- 2 In the first step of the wizard, select **Desktop** and click **Next**.
- 3 In the **Select Desktop Type** step, select **RD Session Host Desktop** and click **Next**.
- 4 Select one or more RD Session Host servers which desktops you want to publish. You can select all available servers, server group(s), or individual servers. Please note that if you have just one RD Session Host, this page will not be displayed.

- 5 Click **Next**.
- 6 In the next step:
 - Specify a name and description for the desktop, and optionally change the icon.
 - Select the **Connect to console** option, so that the users will be connecting to console rather than a virtual session.
 - Select the **Start automatically when user logs on** option if you want to open a desktop as soon as a user logs on.
 - Specify the desired screen resolution using the **Desktop Size** drop-down list. To set a custom width and height of the screen, select **Custom** in the **Size** drop-down list and specify the desired values in the fields provided.
 - In the **Multi-Monitor** drop-down list, select whether the multi-monitor support should be enabled, disabled, or whether the client settings should be used.
- 7 When done, click **Finish** to publish the desktop.

Publishing an Application from an RD Session Host

To publish an application from an RD Session Host follow the below procedure:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Application** and click **Next**.
- 3 On the **Select Server Type** page, select **RD Session Host** and click **Next**.
- 4 On the **Select Application Type** page, select one of the following available options:
 - **Single Application**. Choose this option to fully configure the application settings yourself such as the executable path etc.
 - **Installed Application**. Choose this option to publish an application that is already installed on the server, therefore all of the application settings are automatically configured.
 - **Predefined Application**. Choose this option to publish a commonly used Windows application such as Windows Explorer.
- 5 Click **Next**.
- 6 On the **Publish From** page, specify from which RD Session Hosts the application should be published. You have the following options:
 - **All Servers in Site**. If selected, the application will be published from all servers that are available on the site.
 - **Server Groups**. Select this option and then select individual server groups to publish the application from.
 - **Individual Servers**. Select this option and select individual servers to publish the application from.

Please note that the **Publish From** wizard page will appear only if you have multiple RD Session Hosts. If you have just one server, this page will be skipped by the wizard. The page will also be skipped if the application type that you are installing is **Predefined Application**.

7 Click **Next**.

8 Depending on the application type that you selected on the **Select Application Type** page, the next wizard page will be one of the following:

- If you selected **Single Application**, the **Application** page will open where you have to specify the application settings manually (more about this option later in this section).
- If you selected **Installed Applications**, the **Installed Applications** page will open listing available applications (the applications are grouped by functionality). Select an application you wish to install and click **Next**. Follows the instructions to complete the wizard.
- If you selected **Predefined Application**, the **Select Predefined Applications** page will open listing available applications. Select an application you wish to publish and click **Finish**.

9 If you selected **Single Application** on the **Select Application Type** wizard page, the **Application** page will open. Specify the application settings as follows (see the screenshot below):

Note that if you populate the **Target** field first using the "browse" button ([...]), the application **Name**, **Description**, and icon will be chosen automatically. You can override this selection if you wish.

- **Name**. Choose and type a name for the application.
- **Description**. Type an optional description.
- **Run**. Select the application window state (normal window, minimized, maximized).
- **Start automatically when user logs on**. Select this option if you want to start an application as soon as a user logs on. This option works on desktop versions of Parallels Client only.
- **Change Icon**. Change the application icon (optional).
- **Server(s)**. Allows you to specify the rest of the server parameters individually for each server the application was published from. Select a server from the drop-down list box and specify the parameters. Repeat for other servers in the list.
- **Target**. Specify the application executable path and file name.
- **Start in**. If the **Target** field is valid, this field will be populated automatically. You can specify your own path if needed.
- **Parameters**. If the application accepts startup parameters, you can specify them in this field.

10 When done, click **Finish** to publish the application.

Publishing a Web Application from an RD Session Host

A web application is like any other application that you can publish using the standard application publishing functionality. However, to simplify publishing of straight URL links to web applications, a separate publishing item type is available that allows you to accomplish this task with minimal number of steps.

To publish a web application:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Web Application** and click **Next**.
- 3 On the **Select Server Type** page, select **RD Session Host** and click **Next**.
- 4 On the **Publish From** page, select the server(s) to publish from. Note that if you have just one RD Session Host, the **Publish From** page will not appear.
- 5 On the **Web Application** wizard page that opens, specify the web application name, description, window state, and the URL. Select the **Force to use Internet Explorer** option if needed. To browse for a specific application icon, click **Change Icon**.
- 6 When done, click **Finish** to publish the application.

When published, the web application will appear in the **Publishing > Published Resources** list, just like any other application.

Publishing a Network Folder from an RD Session Host

You can publish a filesystem folder via UNC path to open in Windows explorer. To minimize the number of configuration steps, a special publishing item is available that allows you to publish a network folder from an RD Session Host.

To publish a network folder:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Folder on the file system** and click **Next**.
- 3 On the **Select Server Type** page, select **RD Session Host** and click **Next**.
- 4 On the **Publish From** page, select the server(s) to publish from. Note that if you have just one RD Session Host, the **Publish From** page will not appear.
- 5 On the **UNC Folder** wizard page, specify the usual application properties.
- 6 In the **UNC path** field, enter the UNC path of the folder you wish to publish. Click the **[...]** button to browse for a folder (it may take some time for the **Browse for Folder** dialog to open).

7 Click **Finish** to publish the folder and close the wizard.

When published, the network folder will appear in the **Publishing > Published Resources list**, just like any other application. If you select it and then click the **Application** tab, the application settings will be as follows:

- The **Target** property will always be set to **PublishedExplorer.exe**. This binary is created automatically (via agents pushing) and is simply a copy of the standard **explorer.exe** executable.
- The **Parameters** property specifies the network folder that we want to publish. The folder path can be in any format that the **explorer.exe** can handle.

Please note that although you have all standard application property tabs enabled for this publishing item, at least the following items should be ignored, as they are completely irrelevant:

- **Publish From**
- **File Extensions**

Publishing a Document from an RD Session Host

To publish a document from an RD Session Host, follow the below procedure:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Document** and click **Next**.
- 3 Select **RD Session Host** and click **Next**.
- 4 Specify the content type of the document you want to publish. You can select the content type from the predefined list or specify a custom content type in the **Custom content types** input field.
- 5 Click **Next** when ready.
- 6 On the **Publish From** page, specify from which RD Session Hosts the application should be published. You have the following options:
 - **All Servers in Site**. If selected, the application will be published from all servers that are available on the site.
 - **Server Groups**. Select this option and then select individual server groups to publish the application from.
 - **Individual Servers**. Select this option and select individual servers to publish the application from.

Please note that the **Publish From** wizard page will appear only if you have multiple RD Session Hosts. If you have just one server, this page will be skipped by the wizard.

- 7 On the **Application** page, enter a name, an optional description, a Window state, and an icon if needed.

- 8 Use the [...] button next to the **Target** input field to browse for the document. All other fields will be automatically populated. To edit any of the auto populated fields, highlight them and enter the required details.
- 9 (Optional) In the **Parameters** input field, specify the parameters to pass to the application when it starts.

Note: Use the **Server(s)** drop down list to specify different document settings for a specific server in case the document is configured differently on that particular server. The settings will be saved for each server you select individually.

- 10 Click **Finish** to publish the document.

Publishing Containerized Applications

Turbo (Turbo.net) is a web-based container platform that runs applications on a Windows desktop with no installation required. Parallels RAS provides you with the ability to publish applications hosted by Turbo.net and make them available to Parallels RAS users just like regular applications hosted by RD Session Host servers.

The ability to publish container-based applications allows Parallels RAS administrators to greatly reduce TtV (time to value) and minimize investment and development resources. The integration of the solution provided by Turbo gives you the following immediate benefits:

- Instant access to an online application repository with hundreds of applications available, including:
 - Most web browsers (Chrome, Firefox, Opera, etc).
 - Most application runtimes (JRE and others).
 - Most add-ons (Flash, etc).
 - Open source applications like LibreOffice, VLC Player, etc.
 - Administrative tools like WinSCP, Putty and so on.
- Instant provisioning of all these applications in any combination possible (i.e. a particular version of Google Chrome with a specific Java runtime and Flash) to all endpoints regardless of the platform and version (supports anything from Windows XP to Windows Server 2016).

For more information about Turbo, visit <http://www.turbo.net>

Licensing and supported Turbo repositories

- Parallels RAS uses the free edition of Turbo.net, so no subscription is required.
- Parallels RAS supports application publishing from the public Turbo.net repository only. Private repositories are not supported at the time of this writing.

Enabling or disabling the Turbo.net support in Parallels RAS

Before you can publish applications from Turbo.net, you need to enable this functionality in Parallels RAS as follows:

- 1 In the Parallels RAS Console, select the **Administration** category and then click the **Features** tab in the right pane.
- 2 Select the **Enable Turbo.net application publishing** option. This will enable the Turbo.net functionality in the farm and will install the Turbo runtime on every RD Session Host server, so they can download and run container-based applications.

If later you decide to disable the Turbo.net support in Parallels RAS (by clearing the **Enable Turbo.net application publishing** option), you will see a message box saying that this action will uninstall Turbo runtime from each RD Session Host that has it installed. If later you enable the Turbo.net support again, the runtime will be reinstalled. If you've already published applications from Turbo.net, the message box will also ask you what should be done with them. The available options are:

- **Disable.** All published Turbo.net applications will be disabled.
- **Delete.** All published Turbo.net applications will be removed from Parallels RAS. If you enable the Turbo.net support later, you will have to publish these application again.
- **Keep unchanged.** Applications will remain in Parallels RAS as active applications, but end users will not be able to use them. If later you enable the Turbo.net support, the applications will continue to work normally.

Publishing from Turbo.net

To publish a Turbo.net application:

- 1 In the Parallels RAS Console, select the **Publishing** category.
- 2 Click the **[+] Add** icon at the bottom of the right pane. The publishing wizard opens.
- 3 On the **Select Item Type** page, select the **Containerized Application** option. If the option is disabled (grayed out), it could mean one of the following:
 - The Turbo.net support is disabled in the Parallels RAS farm. See above for the info on how to enable it.
 - The administrator doesn't have the **Allow Publishing changes** permission granted. For more info, see **Configuring Administrator Account Permissions** (p. 39).
- 4 Click **Next**.
- 5 On the **Configure Turbo.net Repository** page, specify an application you would like to publish. Choose from the following options:
 - Double-click a desired category in the application category list to see apps that it contains. Select an application and click **Next**.

- Expand the drop-down list (on the right side) and select from one of the predefined applications. If the app you are looking for is not in the list, type a search condition in the same field and press Enter. The search string can be a full or partial application name, a publisher name, or anything else that can possibly be a part of the app description. Applications that match the search condition will appear in the list from which you can select the one you need.

6 After selecting an application, click **Next**.

7 On the **Application** page, specify the following options:

- **Name:** A name under which the application will be listed in Parallels RAS.
- **Description:** An optional description.
- **Run:** Select the application window state (normal window, minimized, maximized).
- **Start automatically when user logs on:** Select this option if you want to start the application as soon as a user logs on to Parallels RAS. This option works on desktop versions of Parallels Client only.
- **Change Icon:** Specify a different application icon (optional).
- **Server(s):** Allows you to specify **Target**, **Start In**, and **Parameters** settings individually for each RD Session Host through which this application will be published. Select an RD Session Host from the drop-down list and then specify the settings described below.
- **Target:** Specifies the application executable path and file name. This shouldn't be normally changed for Turbo.net applications.
- **Start in:** If the value in the **Target** field is valid, the **Start In** field is populated automatically. You can specify your own path if needed.
- **Parameters:** If the application accepts startup parameters, you can specify them in this field.

8 Click **Finish** to publish the Turbo.net application. The application should appear in the **Published Resources** tree in the **Publishing** category just like any other published resource.

Specifying RD Sessions Hosts through which the Turbo.net application should be published

After you publish a Turbo.net application, you can specify RD Session Hosts through which it should be published. Here's how it works. Application containers reside in the public Turbo.net repository. When you initially publish a containerized Turbo.net application in Parallels RAS, you don't really download it to an RD Session Host. However, as soon as the first user tries to launch a newly published Turbo.net application in Parallels Client, the application container is downloaded to an RD Session Host and the application is started on it. The user then gets access to it just like any other published application.

To specify one or more RD Session Hosts through which the application should be published, select the application in the **Published Resources** tree, choose the **Publishing From** tab page and select one of the following options:

- **All Servers in Site.** The application will be published through all available RD Session Hosts.
- **Server Groups.** This option allows you to specify server groups through which the application should be published.
- **Individual Servers.** Select this option to specify one or more individual servers.

How Turbo.net applications are launched in Parallels Client

When a user launches a Turbo.net application in Parallels Client, the RD Session Host handling the request will attempt to start the application. If this is the first time anybody launches this particular application on this server, the server first downloads the application container from Turbo.net. In such a case, the Parallels Client user will see a message box with a progress indicator while the RD Session Host prepares the application. Once the application is running on the server, the user will see its window and can begin using it. Apart from the progress indicator box, a Parallels Client user will not be able to tell whether a published application is a regular or a Turbo.net application.

Viewing Published Resources Hosted by RD Session Hosts

When you want to remove an RD Session Host or an RD Session Host group from a site, you might want to see the list of published resources hosted by the server or servers in a group. This way you can see which resources will be affected. You can do so as follows:

- 1 In the Parallels RAS Console, select **Farm \ RD Session Hosts**.
- 2 To see published resources for a specific RD Session Host, select the **RD Session Hosts** tab. To see published resources for a group, select the **Groups** tab.
- 3 Right-click a server or a group and choose **Show published resources** (or click **Tasks > Show Published Resources**).
- 4 The **Published Resources** window opens displaying the list of published resources for the selected server or group. Resource information includes:
 - **Name.** Resource name.
 - **Status.** Enabled or disabled.
 - **Type.** "Application" is used for published applications, URLs, network folders, etc. "Desktop" is used for published desktops.
 - **Path.** For published applications, specifies a path to the execute file, URL, or UNC path.
 - **Parameters.** Published application parameters (if any).
 - **Published from.** Site, group(s), or individual server(s).
- 5 To refresh the list, press F5 or click the "recycle" icon (top-right).
- 6 To filter the list, press Ctrl-F or click the magnifying glass icon and then specify the filter criteria for desired column(s).

CHAPTER 6

VDI Hosts

A VDI Host is a server on which a hypervisor is running one or more virtual machines (also known as guest virtual machines or guest VMs). Each VM runs an operating system called the guest operating system (or guest OS). Please note that Parallels Remote Application Server supports Windows as a guest OS only.

By adding a VDI Host server to a Parallels RAS farm, you can create virtual machines from a template and publish desktops and applications from guest operating systems.

In This Chapter

Supported Hypervisors.....	68
Adding a VDI Host.....	69
Modifying VDI Host Configuration	73
Parallels RAS Templates.....	76
VDI Host Pool Management	87
Persistent Guest VMs	90
Publishing from a Guest VM	91
Viewing VDI Host Summary.....	96
Managing VDI Sessions.....	96

Supported Hypervisors

Parallels Remote Application Server supports VDI Hosts based on the following virtualization technologies:

- Microsoft Hyper-V
- Microsoft Hyper-V Failover Cluster
- VMware VCenter
- VMware ESXi
- Citrix XenServer
- QEmu KVM with libvirt
- Nutanix Acropolis
- Remote PC (this is a special type that allows you to create pools of remote PCs).

Adding a VDI Host

Preparing a VDI Host server for Parallels RAS

Before adding a VDI Host to a Parallels RAS farm, you need to determine where the RAS VDI Agent will be installed. Depending on the hypervisor type, the RAS VDI Agent can be installed on one of the following:

- The host server on which the hypervisor is running (Microsoft Hyper-V only).
- A supported version of Windows Server running on a physical box or in a virtual machine. For supported Windows Server versions, see **Software Requirements > RAS VDI Agent** (p. 15).
- A preconfigured Linux-based virtual appliance (provided by Parallels). The appliance can be deployed on any hypervisor on your network.

Important: The hypervisor software, the RAS VDI Agent, guest VMs, and the RAS Publishing Agent must all be deployed in the same subnet.

The following table contains the RAS VDI Agent installation information for each supported hypervisor type:

Hypervisor Type	Agent Runs on the VDI Host	Agent Runs on a Windows Server host (VM or HW)	Agent Runs on Appliance
Microsoft Hyper-V	Yes	No	No
Microsoft Hyper-V Failover Cluster	No	Yes	No
VMware VCenter	No	Yes	Yes (OVA or VMDK)
VMware ESXi	No	Yes	Yes (OVA or VMDK)
Citrix XenServer	No	Yes	Yes (OVA or VMDK)
QEmu KVM with libvirt	No	No	Yes (VMDK)
Nutanix Acropolis	No	Yes	Yes (VMDK)
Remote PC (see the Note below)	No	Yes	No

Note: The **Remote PC** is a special type that can be used to create and manage pools of remote PCs as part of hosted desktop infrastructure (HDI). When you add a VDI host of this type, you can manage it like one of the real VDI hosts with some limitations, such as you cannot create templates and some other strictly VDI-specific functions. The main feature when using this type is the ability to create pools of HDI-based remote PCs and making PCs persistent by assigning an individual PC to a specific user.

In the table above, find the hypervisor type that you are using and see where the RAS VDI Agent can be installed. Depending on the available choices, do one of the following:

- **Agent runs on the VDI Host.** This option is only available if you are using Microsoft Hyper-V. You don't need to do anything special and can proceed to **Searching for VDI Hosts** or **Manually Adding a VDI Host** subsections below.
- **Agent runs on a Windows Server (VM or HW).** Make sure you have a physical box or virtual machine running a supported version of Windows Server. You will need to specify its FQDN or IP address when adding a VDI Host server to the farm.
- **Agent Runs on Appliance.** If this is your choice, you need to download and deploy a virtual appliance as described in the **Deploying a Virtual Appliance** subsection below.

Please note that if both Windows Server and virtual appliance can be used with your hypervisor type, you can choose one or the other according to your preferences.

Deploying a virtual appliance

To download and install a virtual appliance:

- 1 Visit <https://www.parallels.com/products/ras/download/links/>
- 2 On the download page, scroll down to the "VDI Agent Appliances" section and click the **VDI Agent Appliance OVA** or the **VDI Agent Appliance VMDK** link to download the appliance. See the table above for the appliance type (OVA or VMDK) compatible with the hypervisor that you are using.
- 3 After downloading the virtual appliance, you need to deploy it on a hypervisor. For the information about deploying a virtual appliance, please refer to your hypervisor documentation.

You can now add the VDI Host server to the Parallels RAS farm. You can search your network for available VDI Hosts or you can add a specific VDI Host to the farm manually. The following subsections describe how to do it.

Requirements to push install RAS VDI Agent on a VDI Host

To push install the RAS VDI Agent on a VDI host, the following requirements must be met:

- The firewall must be configured on the server to allow push installation. Standard SMB ports (139 and 445) need to be open. See also **Port Reference** (p. 252) for the list of ports used by Parallels RAS.
- SMB access. The administrative share (\\server\\c\$) must be accessible. Simple file sharing must be enabled.
- Your Parallels RAS administrator account must have permissions to perform a remote installation on the server. If it doesn't, you'll be asked to enter credentials of an account that does.
- The VDI Host server should be joined to an AD domain. If it's not, the push installation may not work and you will have to install the Agent on the server manually. Please see **Installing RAS VDI Agent Manually** (p. 72).

Searching for VDI Hosts

To search for available VDI hosts on your network:

- 1 In the RAS console, navigate to **Farm / Site / VDI Hosts**.
- 2 On the **Virtual Desktop Hosts** tab page, click **Tasks > Discover VDI hosts**.
- 3 A dialog opens displaying the discovered VDI hosts (you may have to wait until the discovery completes). If no VDI hosts are found, you can add a host manually (jump to the **Manually Adding a VDI Host** subsection below).
- 4 You can select the **Show all hosts** option to display all available hosts, including the hosts that don't meet the minimum system requirements. To refresh the list, click **Refresh**.
- 5 Click **OK** to add the VDI host to the Parallels RAS farm.

Manually adding a VDI Host

To add a VDI host manually:

- 1 In the **Tasks** drop-down menu, click **Add** to launch the **Add VDI Server** wizard.
- 2 In the **VDI Type** field, select the hypervisor type that your VDI host is running and specify the host's FQDN or IP address.
- 3 Select the **Add Firewall Rules** option to automatically configure the firewall on the server. See **Port Reference** (p. 252) for details.
- 4 If applicable, select the **VDI Agent Service is running on Appliance** option.
- 5 If the **VDI Agent** field is enabled, specify the FQDN or IP address of the server where the RAS VDI Agent is (or will be) installed. This can be either a virtual appliance (if you use one) or a Windows Server host (physical box or virtual machine).
- 6 Click **Next**.

The wizard will advance to the **VDI Agent Information** dialog and will try to connect to the VDI Agent that you specified in the **VDI Agent** field in the previous step. If the Agent is not installed, do the following:

- 1 Click **Install** to push install the agent on the specified server.
- 2 In the **Installing RAS VDI Agent** dialog, select the appropriate OS in the **OS** drop-down list. If the Agent is to be installed in a virtual appliance, select "RAS Appliance".
- 3 Click **Install** to install the Agent. When prompted, enter the server (or virtual appliance) administrator credentials.
- 4 Click **Done**. If the automatic installation of the RAS VDI Agent fails for any reason, refer to the **Installing RAS VDI Agent Manually** section (p. 72).

Once the RAS VDI Agent is installed, do the following:

- 1 In the **VDI Agent Information** dialog, click **Add** to add the VDI Host to the Parallels RAS farm.

Note: If your VDI Host server is running Nutanix Acropolis or KVM and you see a warning message that Nutanix Acropolis (or KVM) was not found, ignore it and continue.

- 2 In the **Host Properties** dialog that opens, click the **Credentials** tab.
- 3 Type the VDI Host administrator credentials and click the **Check Credentials** button.
- 4 Click **OK** to close the **Host Properties** dialog.
- 5 In the main Parallels RAS Console window, click **Apply** to apply the changes to Parallels RAS.

Checking the RAS VDI Agent Status

To verify that the RAS VDI Agent is installed and functions properly, do the following:

- 1 First, you can look at the **Agent State** column in the **VDI Hosts** list (**Farm / VDI Hosts / Virtual Desktop Hosts**). If there's a problem with the agent, the column will display an appropriate error message.
- 2 Right-click a host and then click **Troubleshooting > Check Agent** in the context menu.
- 3 The **VDI Agent Information** dialog opens displaying the information about the VDI Agent, VDI Services, and other related info.
- 4 If the VDI Agent is not installed, click the **Install** button and follow the onscreen instructions. See **Adding a VDI Host (Manually Adding a VDI Host subsection)** (p. 69) for more info.

Installing RAS VDI Agent Manually

You may need to install the RAS VDI Agent on a VDI Host manually if the automatic push installation cannot be performed for any reason.

Note: You can only use these instructions to install RAS VDI Agent in Windows.

Installing RAS VDI Agent Manually

To install the agent:

- 1 Log into the server where the RAS VDI Agent is to be installed using an administrator account and close all other applications.
- 2 Copy the Parallels Remote Application Server installation file (**RASInstaller.msi**) to the server and double-click it.
- 3 Once prompted, click **Next** and accept the End-User license agreement.
- 4 Specify the path where the RAS Agent should be installed and click **Next**.
- 5 Select **Custom** and click **Next**.
- 6 Click on the RAS VDI Agent and select **Entire Feature will be installed on local hard drive** from the drop-down menu.

- 7 Ensure that all other components are deselected and click **Next**.
- 8 Click **Install** to start the installation. Click **Finish** once the installation is finished.

The RAS VDI Agent does not require any configuration. Once the agent is installed, highlight the server name in the RAS Console and click **Troubleshooting > Check Agent**. If the agent is installed properly, the status should change to **Agent Installed**.

Uninstalling RAS VDI Agent

To uninstall the RAS VDI Agent from a server:

- 1 Navigate to **Start > Control Panel > Programs > Uninstall a Program**.
- 2 Find **Parallels Remote Application Server** in the list of installed programs.
- 3 If you don't have any other Parallels RAS components on the server that you want to keep, right-click **Parallels Remote Application Server** and then click **Uninstall**. Follow the instructions to uninstall the program. You may skip the rest of these instructions.
- 4 If you have other RAS components that you want to keep on the server, right-click **Parallels Remote Application Server** and then click **Change**.
- 5 Click **Next** on the Welcome page.
- 6 On the **Change, repair, or remove** page, select **Change**.
- 7 On the next page, select **Custom**.
- 8 Select **RAS VDI Agent**, then click the drop-down menu in front of it, and click **Entire feature will be unavailable**.
- 9 Click **Next** and complete the wizard.

Change VDI Host Site Assignment

You can assign a VDI Host to a different site in your farm if needed. Please note that this functionality is only available if you have more than one site in your farm.

To change the site assignment:

- 1 Right-click a VDI Host and then click **Change Site** in the context menu. The **Change Site** dialog opens.
- 2 Select a site in the list and click **OK**. The server will be moved to the **VDI Hosts** list of the target site (**Farm / <new-site-name> / VDI Hosts**).

Modifying VDI Host Configuration

Read this section to learn how to modify the configuration of a VDI Host in Parallels RAS.

Configuring a VDI Host

To configure a VDI host:

- 1 In the RAS Console, navigate to **Farm / Site / VDI Hosts**.
- 2 Select the **Virtual Desktop Hosts** tab page in the right pane.
- 3 Select a VDI Host in the **VDI Hosts** list and click **Tasks > Properties**. The **Host Properties** dialog opens.

Note: Some of the properties described below may be unavailable on some servers. This depends on the type of the hypervisor installed on the host server.

Enabling or disabling a VDI Host in the farm

By default a VDI Host is enabled in the farm. When it is disabled, published applications and virtual desktops cannot be served from it. To enable or disable a VDI Host, use the **Enable Host in site** option on the **Properties** tab page.

Configuring VDI Host connection settings

The following properties can be configured on the **Properties** tab page:

- **VDI Type:** Hypervisor type.
- **VDI Version:** Hypervisor version. If the hypervisor version that you are using is not listed, select **Other**.
- **VDI Host:** The VDI host IP address.
- **VDI Port:** Port number on which the VDI Host listens for incoming connections.
- **VDI Agent Service is running on Appliance:** This option is enabled or disabled based on whether this feature is supported on the selected hypervisor. It specifies whether the RAS VDI Agent is running on a virtual appliance.
- **VDI Agent:** The virtual appliance IP address. This field is enabled if the option above is selected.
- **Change Direct Address:** If selected, allows you to specify the IP address that can be used by Parallels Clients to directly connect to the host. The direct address is only used in the Direct Connection mode and it could be an internal or external IP address.

Specifying credentials

On the **Credentials** tab page, specify the user name and password to log into the VDI Host. Click the **Check Credentials** button to verify the credentials that you've entered.

Configuring the RAS VDI Agent on the server

Each VDI host in the farm has the RAS VDI Agent installed (or running on an appliance). The VDI agent can be configured on the **Agent Settings** tab page.

- **Max Connections:** Specifies the maximum allowable number of powered-on guest VMs.
- **Publishing Session Timeout:** Specifies the amount of time each session remains connected in the background after the user has closed the published application. This option is used to avoid unnecessary reconnections with guest VMs.
- **Allow Client URL/Mail Redirection:** Select this option to allow http and mailto links to be opened using a local application on the client computer rather than the server resources.
- **Preferred Publishing Agent:** Select a Publishing Agent with which the RAS VDI Agent should communicate. This can be helpful when site components are installed in multiple physical locations communicating through WAN. You can decrease network traffic by specifying a more appropriate Publishing Agent.
- **Allow file transfer command:** Allows you to enable or disable the remote file transfer functionality. For more information, see **Enabling or Disabling Remote File Transfer (p. 206)**.
- **Allow local to remote drag and drop.** Enables the drag and drop functionality in a remote application. When this option is enabled, an end user can drag and drop files to a remote application on their local device. For example, a user can drag and drop a file to the Acrobat reader to open a PDF file. Or a user can drag and drop a file to Windows Explorer, which runs remotely, etc.

Note: at the time of this writing, the drag and drop functionality is only supported on Parallels Client for Windows and Parallels Client for Mac.

Configuring RDP printing

The **RDP Printer** tab allows you to configure the renaming format of redirected printers. The format may vary depending on which version and language of the server you are using. Select the **RDP Printer Name Format** option specifically for the configured server:

- **Prntername (from Computername) in Session no.**
- **Session no. (computername from) Prntername**
- **Prntername (redirected Session no)**

The other RDP Printing options available in the RDP Printer tab are:

- **Remove session number from printer name**
- **Remove client name from printer name**

Configuring VDI Host maintenance time window

The **Scheduler** tab page allows you to create a maintenance time window for the server. During this time, published resources won't be accessible from that server.

To configure a maintenance time window click **Tasks > Add** and then set the following options:

- **Start date**
- **Time**
- **Duration**
- **Repeat**

The **On disable** option allows you to specify what should happen to current sessions when a scheduled task triggers.

Parallels RAS Templates

Parallels RAS Templates are used to automate the creation and deployment of guest VMs in Parallels Remote Application Server. A RAS Template is created as a copy of an existing guest VM but cannot run as a regular virtual machine. You can customize a RAS Template for use with Parallels Remote Application Server according to your needs. Once a template is ready, you can use it to create guest VM clones (copies) that will inherit all of the properties of the template. Guest VMs can then be used to serve applications, documents, and desktops to your Parallels RAS users.

RAS Templates can be created with the following versions of Windows as a guest OS:

- Windows XP SP3
- Windows Vista
- Windows 7
- Windows 8
- Windows 10

Read the following topics to learn how to create and configure Parallels RAS Templates and guest VMs:

- Creating a RAS Template (p. 77)
- Configuring a RAS Template (p. 77)
- How Guest VMs are Created From a Template (p. 82)
- Managing Guest VMs (p. 82)
- RAS Template Maintenance (p. 85)

Creating a RAS Template

To complete the tasks described in this section, your guest VM must be a domain member and the Parallels RAS Console must be run under an account with administrative privileges on the guest VM (by default, the Domain Admins group has such permissions). This is necessary to perform push installation of the RAS Guest Agent software from the Parallels RAS Console.

If the conditions above cannot be met for any reason, you can try installing the agent software manually by running the main Parallels Remote Application Server installer (`RASInstaller.msi`) in Windows in the VM. Use the **Custom** installation option and select the **RAS Guest Agent** component to install.

Note: To create a template from an existing virtual machine, the guest OS (Windows) must be configured to obtain an IP address from a DHCP server.

To create a RAS Template:

- 1 In the RAS Console, navigate to **Farm / Site / VDI Hosts**.
- 2 Select the **RAS Templates** tab in the right pane.
- 3 In the **Tasks** drop-down menu, click **Add**.
- 4 In the **Guest VM List** dialog, select a guest VM from which you would like to create a RAS Template and click **OK**.
- 5 In the next step, Parallels RAS will check if the source VM has the RAS Guest Agent installed. If the agent is not installed, click **Install** and then specify credentials to log in to Windows in the VM. Click **Done** when finished.
- 6 In the **Guest VM Agent Information** dialog, click the **Make Template** button to create a RAS Template.
- 7 The source VM will be powered off and a copy of it will be created to become a new RAS Template.

Once the copy of the VM is created, the **Create Parallels RAS Template Wizard** will automatically open. Read on to learn how to use the wizard to configure a RAS Template (p. 77).

Configuring a RAS Template

The **Create Parallels RAS Template Wizard** is used to configure a new Parallels RAS Template. You need to complete the wizard before you can use the template to create virtual machines from it. The wizard consists of several pages, which are described below.

Note: You can access the same configuration pages for an existing RAS Template by selecting it in the list and then clicking **Tasks > Properties**. This will open a dialog (instead of the wizard described below), but the pages and configuration options will be the same.

General

On the first page of the wizard (or the **General** tab page when modifying an existing template), specify the following options:

- **RAS Template.** Specify a name for the template.
- **Maximum guest VMs.** Specify the maximum number of guest VMs that can be created from this template. Once the number of existing guest VMs exceeds this number, a VM is deleted to comply with the limitation.
- **Pre-created guest VMs.** Specify the number of VMs that will be automatically created in advance. This is done in order to have some VMs ready right away. If all pre-created VMs are already in use and another one is needed, it will be created on demand.
- **Virtual machine name prefix.** Specify a name prefix for guest VMs. A VM ID will be appended to it to make the final VM name unique.
- **Delete unused guest VMs after the following period.** Enable this option to automatically delete VMs that haven't been used for a specified period of time. Use the drop-down list to specify the time period.
- **Clone method.** Specify whether virtual machines should be created from this template as full or linked clones (see the **Note** and the **Full vs. linked clones** section below for more info). These options are only available when you create a new RAS Template; they are disabled when you modify the configuration of an existing template.

Note: If the **Create a linked clone** option is grayed out, it means that the current version of Parallels RAS does not support linked clones with the hypervisor that you are using. At the time of this writing, support for linked clones is available for VMware, Microsoft Hyper-V, and KVM. Please note that Citrix XenServer support in Parallels RAS includes full clones only. Fast clones support will be added in the near future.

Full vs. linked clones: Guest VMs are created as clones (copies) of a RAS Template. A full clone is a complete copy of a template. As such, it occupies as much space on the physical hard drive as the source template and takes a significant time to create. A linked clone is a copy of a template made from a snapshot that shares virtual disk with the source template, therefore it takes much less space on the physical hard drive and it takes only a couple of minutes to create. Linked clones have other advantages, such as simplified disaster recovery, added security, single image management, to name a few.

Advanced

On the **Advanced** page, specify the following options:

- **Folder.** Specify the folder where guest VMs created from this RAS Template will be stored. This option is available if you are using Hyper-V, Hyper-V Failover Cluster, VMware vCenter, Citrix XenServer, KVM, or Nutanix.
- **Native Pool.** Specify the native pool to add the VMs to. This option is available if you are using VMware ESX and VMware vCenter.

Preparation

On the **Preparation** page, you can select and configure an image preparation tool. First, select whether you want to use RASprep or Sysprep.

RASprep is the Parallels RAS tool, which prepares Windows in a VM after cloning it from a base image. RASprep performs the following tasks during the initial startup of each new VM:

- Creates a new computer account in Active Directory for each guest VM.
- Gives the guest VM a new name.
- Joins the guest VM to the Active Directory domain.

Compared to Sysprep, RASprep works much faster because it modifies a lower number of configurable parameters and requires less reboots. The following table lists the main differences between RASprep and Sysprep:

Operation	RASprep	Sysprep
Delete local accounts	No	Yes
Generate new SIDs	No	Yes
Unjoin the parent guest VM from the domain	No	Yes
Change computer name	Yes	Yes
Join the new instance to the domain	Yes	Yes
Language, regional settings, date and time customization	No	Yes
Number of reboots	1	2 (seal, mini-setup and domain joining)

After selecting the preparation tool, specify the following options:

- **Computer name.** A name pattern that should be used to assign a computer name to a VM. For example, Windows10-RAS-%ID%.
- **Owner name.** Owner name (optional).
- **Organization.** Organization name (optional).
- **Administrative password.** Local Windows administrator password.
- **Join domain.** Name of a domain for the VM to join.
- **Administrator.** Domain account.
- **Password.** Domain account password.
- **Target OU.** Full DN of an organizational unit. Click the [...] button to browse Active Directory and select an OU.

License Keys

On the **License Keys** page, specify the license key information that will be used to activate virtual machines created from this template.

First, select the license key management type that you are using in your organization (KMS or MAK). Parallels recommend to use KMS because MAK has limited activations.

Key Management Service (KMS): If you are using KMS, click the **Finish** button to save the template configuration information. Virtual machines that will be created from this template will look for KMS in DNS (at the end of the OS mini-setup and domain joining) and will be activated accordingly.

Multiple Activation Keys (MAK): If you are using MAK, do the following:

- 1 Click the **Add** button and type a valid key in the **License key** field.
- 2 In the **Max guest VMs** field, specify the maximum number of VMs that can be created from this template.
- 3 Click **OK**.

Note: Parallels RAS does not keep the old MAK key in guest VMs if it was updated in the Parallels RAS Template properties.

Summary

Review the template summary information. If not satisfied, click **Back** to correct the info as needed.

Select the **Launch Parallels RAS Test Template Wizard on completion** option to start a wizard allowing you to test the health of the template. The wizard allows you to see upon completion that all post-prep activities complete correctly. This includes checking DHCP settings, DNS registration, correct VLAN, joining the AD domain, correct target OU, etc. The wizard is described in the topic that follows this one (p. 81).

Click **Finish** to save the template configuration information and close the wizard.

If you need to change the template configuration later, select it in the RAS Templates list and click **Tasks > Properties**. Use the dialog that opens to view and modify the template properties. The dialog consists of tab pages which are exact copies of the wizard pages described above.

Parallels RAS Test Template Wizard

If you selected the **Launch Parallels RAS Test Template Wizard on completion** option on the last page of the template configuration wizard, the **Parallels RAS Test Template Wizard** opens allowing you to test the health of the RAS Template. The wizard allows you to see upon completion that all post-prep activities complete correctly. This includes checking DHCP settings, DNS registration, correct VLAN, joining the AD domain, correct target OU, etc. You can also open this wizard by right-clicking a RAS Template in the Parallels RAS Console and choosing **Test**.

The test procedure consists of the following steps:

- 1 The RAS Template is switched temporarily to the "Test" mode designed specifically for this purpose. Please note that while the template is in this mode, all other operations are blocked until the test is finished and the template exits the test mode.
- 2 A guest VM is cloned from it to be used for testing. The VM is kept on the server for the duration of the test and will be deleted afterwards.
- 3 A series of tests is then run on the guest VM to test the template from which it was created.
- 4 Once the test is complete, a report is displayed on the screen showing the test results.

When the wizard starts:

- 1 The Welcome page opens. Read the info that it contains and click **Next** when ready.
- 2 The next page displays the list of individual tests that will be performed, including:
 - **Check guest VM Agent:** This test tries to communicate with the RAS Guest Agent installed in the VM. If the agent responds, it means that the VM has been created and started successfully.
 - **Check domain membership:** Checks that the computer has joined the AD domain.
 - **Check target OU:** Checks that the RDP connection to the computer is possible with domain credentials.
 - **Launch Parallels Client:** This test launches Parallels Client and establishes a connection with the guest VM.
- 3 While the test is running, the progress indicator is displayed on the screen. If needed, you can cancel the test at any time by clicking the **Cancel** button.
- 4 Once all tests are completed, you will see a page displaying the test results:
 - **Success:** If all tests complete successfully, the temporary guest VM will be marked for deletion and the RAS Template will be switched back to the normal operation mode.
 - **Failure:** If one or more tests fail, you will see the corresponding info and will be able to download the log file by clicking the **Download log file** link. You will also have an option to switch the RAS Template to maintenance mode, which will prevent creating guest VMs from it until it is fixed.
- 5 Click **Finish** to close the wizard.

How Guest VMs Are Created From a Template

After a RAS Template is created, Parallels RAS begins creating guest VMs from it, one virtual machine at a time. The number of VMs is determined by the value specified in the **Pre-created guest VMs** field on the **Properties** page (see **Configuring a RAS Template** (p. 77)).

As soon as a user connects to an existing guest VM, Parallels RAS begins creating a new guest VM from the template, so the number of pre-created VMs remains unchanged. Please note that creating a new guest VM from a template takes some time, especially when a template is configured to create full clones (linked clones are created much faster). If a guest VM is in the middle of being created, and no other VMs are available, the user will have to wait until the VM is ready.

If a guest VM encounters a problem during the preparation stage (for any reason), it remains on the server but cannot be used. You can identify such VMs in the **Template Guest VMs List** dialog (described in the section that follows this one) by the "Preparation failed" value in the **Status** column. Unless a VM like this is repaired or recreated, it will be automatically removed after the time period specified in the **Auto remove guest VMs which failed preparation after** field on the **VDI Hosts > RAS Templates** tab page. For more information on how to recreate a guest VM, please see the **RAS Template Maintenance** section (p. 85).

When a guest VM is no longer in use, and if the number of existing VMs exceeds the "pre-created" value, a VM is deleted after the time period specified in the **Delete unused guest VM after** field on the **Properties** page. If you didn't select that option, a VM is never deleted, but the total number of VMs will never exceed the value specified in the **Maximum guest VMs** field on the **Properties** page.

Managing Guest VMs

Viewing guest VMs created from a RAS Template

To view the list of guest VMs created from a RAS Template, select a template on the **RAS Templates** tab page and click **Tasks > Show guest VMs**. The **Template Guest VMs List** dialog opens listing guest VMs.

The buttons on the right side of the dialog perform the following actions:

- **Refresh.** Refreshes the list.
- **Delete.** Deletes a selected guest VM (see the **Deleting a guest VM** subsection below).
- **Send message.** Allows you to send a message to the user who is currently connected to a guest VM. For example, when you apply updates to the parent RAS Template, you need all users to be logged off, so you can use this button to send an appropriate message to connected users.

- **Log off.** Logs off the current session from a selected guest VM.

Performing Guest VM Power Operations

The power operations icons at the bottom of the dialog allow you to start, stop, suspend, and reset a guest VM. To perform an action, select a guest VM and click a icon corresponding to the desired action.

Note: If you are using Nutanix Acropolis as the hypervisor, the suspend operation is not available (the **Suspend** icon is disabled). The reason for this is Nutanix Acropolis does not support the suspend operation on its virtual machines.

Checking the RAS Guest Agent status

A guest VM should have the RAS Guest Agent installed in it. The agent is installed by default when a guest VM is created from a RAS Template. If a guest VM was created outside the RAS Console using the native hypervisor tools, it may not have the agent installed in it. In such a case, the guest VM will be able to serve only the desktop, but no applications or documents.

To check if the RAS Guest Agent is installed in a guest VM:

- 1 Select a guest VM in the list and then click **Tasks > Check Agent**.
- 2 The **Guest VM Agent Information** dialog opens displaying the information about the RAS Guest Agent.
- 3 If the agent is not installed, click the **Install** button and follow the instructions. The agent will be push installed in Windows running inside the guest VM.

Configuring guest VM properties

To view and modify properties of a guest VM, select a guest VM and click **Tasks > Properties**. The **Guest VM Advanced Settings** dialog opens. In the dialog, configure the following properties:

- **Do not use this guest VM.** If selected, the guest VM will not be used for remote application and desktop publishing.
- **Computer name.** Specifies the guest VM network name (domain name or IP address) used to connect to this guest VM.
- **Port.** Specifies the port number through which Parallels RAS communicates with this guest VM.
- **Override default settings.** Allows you to specify your own VM settings. By default, this option is cleared and a VM is configured using default settings. To specify custom settings, select this option and then choose your own values for **Connection timeout**, **Protocol**, **If session disconnects**, and **End a disconnected session** options. For the descriptions of these options, please see the **Configuring Default Guest VM Properties** subsection below (the options are exactly the same in both places).

Configuring default guest VM properties

By default, all guest VMs in a site are configured using the default VM settings. The defaults are defined on a site level and are automatically applied to all newly created VMs regardless of which VDI Host or VM pool they belong to.

To view and modify the default settings, in the **Template Guest VMs** dialog, click **Tasks > Default settings** (or click the gear icon). The **Default Guest VM Advanced Settings** dialog opens allowing you to view and modify the following settings:

- **Connection timeout.** If a connection with the guest VM cannot be established in this time period, Parallels RAS will cancel the connection attempt.
- **Protocol.** Specifies a protocol that Parallels RAS uses to communicate with the guest VM.
- **If session disconnects.** Specifies the action that should be taken if a user disconnects from a session. Actions include **Suspend**, **Reset**, **Keep Current State**, **Stop**. Use the **after** field to specify the amount of time that has to pass before the selected action is executed.

Note for Nutanix Acropolis users: Nutanix Acropolis does NOT support the suspend operation for its VMs. If **Suspend** is selected in this field, no action will be applied to a Nutanix Acropolis VM when a session disconnect event occurs (a corresponding error will be recorded in the VDI Agent log). Since **Suspend** is the default action, you should consider selecting a different one if you are using Nutanix Acropolis.

Any modifications you make to default VM settings are immediately applied to all VMs in the current site that use them.

Deleting a guest VM

To delete a guest VM, select it and then click the **Delete** button on the right side of the window.

Important: If you are using VMware ESXi, you should ONLY delete a guest VM from the **Template Guest VMs** dialog in the Parallels RAS Console. You should NOT try to delete a guest VM using the VMware native client or web interface. If you do, the VMware tools will delete not only the VM but its parent RAS Template as well (which will also invalidate all other guest VMs created as linked clones from this template). The reason for this is ESXi client interface treats linked clones as standalone VMs. Parallels RAS uses a different approach when creating or deleting linked clones, which allows it to treat linked clones as what they are.

Managing guest VMs that failed preparation

If a guest VM encounters a problem during the preparation stage (for any reason), it remains on the server but cannot be used. You can identify such VMs in the **Template Guest VMs List** dialog (described above) by the "Preparation failed" value in the **Status** column. Unless a VM like this is repaired, it will be automatically removed after the time period specified in the **Auto remove guest VMs which failed preparation after** field on the **RAS Templates** tab page. You can set any of the available time periods by selecting it from the drop-down list or you can type a desired value, such as "8 days" or "12 hours".

Recreating a guest VM

If something happens to a guest VM and it becomes unusable, you don't have to delete it and create a new one. Instead, you can recreate it keeping its name and MAC address. This way none of the other site settings, which may rely on a broken guest VM, will be affected. Examples of such settings may include publishing from VDI desktops (i.e. specific guest VMs selected), desktop persistence, AD policies filtered via computer groups. Another reason for recreating a guest VM is to apply changes made to the RAS Template (when you exit from maintenance without executing the Recreate command).

To recreate one or more guest VMs:

- 1 In the Parallels RAS Console, navigate to **Farm \ Site \ VDI Hosts \ RAS Templates**.
- 2 To recreate all deployed guest VMs, click the **Tasks** drop-down menu and choose **Recreate All Guest VMs**.
- 3 To recreate a specific guest VM (or multiple guest VMs), click **Tasks > Show Guests VMs**.
- 4 In the **Template Guest VMs** dialog, select one or more guest VMs and then click the **Recreate** button.

When you recreate a guest VM:

- The procedure deletes a VM and creates a new one from the same template.
- The new guest VM retains the same computer name and MAC address as the one it replaces.
- If a guest VM is running, all unsaved data in its memory will be lost. For this reason, an important data should be saved to a disk.

RAS Template Maintenance

In addition to viewing and modifying configuration properties of a RAS Template, you can perform a number of maintenance tasks on it. These tasks are described below.

Updating RAS Guest Agent inside a template

A RAS template should have the latest version of RAS Guest Agent installed in it. The agent is installed when you create a template. When a new version of RAS Guest Agent becomes available, it should be updated.

To check the RAS Guest Agent status inside a template, click **Tasks > Check agent**. If the agent is up to date, a message box will be displayed confirming this. If a newer version of RAS Guest Agent is available, you'll see a dialog asking if you want to update it. Click **Yes** to update the agent. If you click **No**, you can check the status again later and update the agent at that time.

Using the RAS Template maintenance mode

The RAS Template maintenance mode is used to update software inside a RAS Template. For instance, if you want to install a Windows server pack or a software update, you need to use the maintenance mode.

Depending on whether a RAS Template is configured for full or linked clones, the maintenance mode is used slightly differently.

Full clones:

If your RAS Template is configured to create full clones, do the following:

- 1 Select a RAS Template and click **Tasks > Maintenance**. The template becomes disabled (grayed out), so all operations on it (including creating new guest VMs) are suspended.
- 2 Using native tools of the corresponding hypervisor, start the template as a normal virtual machine.
- 3 Install Windows updates or software as necessary.
- 4 When done, shut down the virtual machine.
- 5 Back in the RAS Console, select the template and click **Tasks > Maintenance** again to exit the maintenance mode.

Please note that any updates applied to a template in the maintenance mode will only affect future clones. Existing guest VMs that were created from this template as full clones will not be affected, so if you want them to include these updates, you will have to recreate them.

Linked clones:

Since linked clones share the virtual hard disk with a snapshot of a RAS Template, you need to take additional steps compared to full clones.

First, you need to notify guest VM users to save their data and log off. This is necessary for existing guest VMs to include the updates that you will install in the template. Once all users are logged off, do the following:

- 1 Select the RAS Template and click **Tasks > Maintenance**. The template becomes disabled (grayed out), so all operations on it (including creating new guest VMs) are suspended.
- 2 Using native tools of the corresponding hypervisor, start the template as a normal virtual machine.
- 3 Install Windows updates or software as necessary.
- 4 When done, shut down the virtual machine.

- 5 Back in the RAS Console, select the template and click **Tasks > Maintenance** again to exit the maintenance mode. A dialog is displayed asking if you would like to recreate existing guest VMs. If you click **No**, then the dialog is closed and the existing guest VMs are left in their current state, which means that the updates that you installed will NOT appear in the existing VMs. If you click **Yes**, read on.
- 6 If you click **Yes** in the previous step, existing guest VMs will be examined for active connections. If an active connection is detected, another dialog opens asking if you want to proceed:
 - If you click **Yes**, all active sessions are forcibly logged off and existing guest VMs (linked clones), together with the corresponding snapshot, are deleted and a new snapshot and VMs are created from the updated RAS Template.
 - If you click **No**, the **Template Guest VMs List** dialog opens where you can view the current state of each available guest VM. The dialog gives you full control over a guest VM. You can send a message to the user and you can log the user off. Once all active sessions are logged off, click **OK**. The existing guest VMs and the corresponding snapshot are deleted and a new snapshot and VMs are created from the updated RAS Template.

When you are done configuring a RAS Template, click the **Apply** button on the main RAS Console window to commit the changes to Parallels Remote Application Server.

VDI Host Pool Management

Pools offer administrators more flexibility when managing an extensive number of guest VMs, especially when they are implemented in large company infrastructures. The RAS Console provides you with the framework and tools needed to create a complete Pool Management foundation.

To manage pools, in the RAS Console, navigate to **Farm / Site / VDI Hosts** and then click the **Pool Management** tab.

Read on to learn how to:

- Add and delete pools (p. 87)
- Add and delete pool members (p. 88)
- Configure guest VMs in a pool (p. 88)
- Use a wildcard to filter VMs (p. 90)

Adding and Deleting Pools

To add a pool, click the **Tasks** drop-down menu above the **Pools** list and then click **Add** (or click the plus-sign icon). Type a pool name and then click anywhere outside the edit field.

To delete a pool, right-click it and then click **Delete** (or click the minus-sign icon, or **Tasks > Delete**).

Adding and Deleting Pool Members

A VDI pool can contain different types of members. These could be all available guest VMs, specific guest VMs, and guest VMs created from a template.

To add a member to a pool:

- 1 Select a pool in the **Pools** list.
- 2 In the **Tasks** drop-down menu above the **Members** list (the upper right-hand corner of the **Members** area), click **Add** and choose a member type from the following list:
 - **All guest VMs in host.** All guest VMs that are located on a particular VDI host. After clicking this options, you'll be able to select a VDI host.
 - **Guest VM.** A specific guest VM located in the farm. After clicking this options, you'll be able to select a guest VM from the list.
 - **Native pool.** A group of guest VMs that were natively configured in the hypervisor as a pool. Please note that a hypervisor may use a different term for pools (e.g. "resource pools"). After clicking this option, you'll be able to select a native pool from the list, if any are available.
 - **RAS template.** Guest VMs that are automatically created from a RAS Template. After selecting this option, you'll be able to select a RAS template. For more information about RAS Templates, refer to **Managing RAS Templates** (p. 76).
- 3 After you click one of the above menu items, you will be presented with the list of the available hosts, guest VMs, or templates from which you can make your selection.

To delete a member from a pool, select the pool, then select a pool member you wish to delete, and then click **Tasks > Delete**.

Configuring Guest VMs in a Pool

To configure a guest VM included in a pool, select a pool and then click **Tasks > Show Guest VMs in Pool** to open the **Guest VM List** dialog.

Checking the RAS Guest Agent status

A guest VM must have the RAS Guest Agent installed in it. The agent is installed by default when a guest VM is created from a RAS Template. If a guest VM was created outside the RAS Console using the native hypervisor tools, it may not have the agent installed in it. In such a case, the guest VM will be able to serve only the desktop, but no applications or documents.

To check if the RAS Guest Agent is installed in a guest VM:

- 1 Select a guest VM in the list and then click **Tasks > Troubleshooting > Check agent**.

- 2 The **Guest VM Agent Information** dialog opens displaying the information about the RAS Guest Agent.
- 3 If the agent is not installed, click the **Install** button and follow the instructions. The agent will be push installed in Windows running inside the guest VM.

Performing guest VM power operations

The power operations icons at the bottom of the dialog allow you to start, stop, suspend, and reset a guest VM.

Note: If you are using Nutanix Acropolis, the suspend operation is not available (the **Suspend** icon is disabled). The reason for this is Nutanix Acropolis does not support the suspend operation on its virtual machines.

Configuring guest VM properties

To view and modify properties of a guest VM:

Select a guest VM and click **Tasks > Properties**. The **Guest VM Advanced Settings** dialog opens. In the dialog, configure the following properties:

- **Do not use this guest VM.** If selected, the guest VM will not be used for remote application and desktop publishing.
- **Computer name.** Specifies the network name (domain name / IP address) that the system will use to connect to this guest VM.
- **Port.** Specifies the port number that the system will use to connect to this guest VM.
- **Override default settings.** Allows you to specify your own VM settings. By default, this option is cleared, so a VM is configured using default settings. To specify custom VM settings, select this option and then choose your own values for **Connection timeout**, **Protocol**, **If session disconnects**, and **End a disconnected session** options. For the descriptions of these options, please see the **Configuring Default Guest VM Properties** subsection below.

Configuring default guest VM properties

By default, all guest VMs in a site are configured using the default VM settings which are defined on a site level and automatically applied to all newly created VMs.

To view and modify the default settings, in the **Guest VM List** dialog, click **Tasks > Default settings** (or click the gear icon). The **Default Guest VM Advanced Settings** dialog allows you to view and modify the following properties:

- **Connection timeout.** If a connection with the guest VM cannot be established in this time period, Parallels RAS will cancel the connection attempt.
- **Protocol.** Specifies a protocol that Parallels RAS uses to communicate with the guest VM.

- **If session disconnects.** Specifies the action that should be taken if a user disconnects from a session. Actions include **Suspend**, **Reset**, **Keep Current State**, **Stop**. Use the **after** field to specify the amount of time that has to pass before the selected action takes place.

Note for Nutanix Acropolis users: Nutanix Acropolis does NOT support the suspend operation on its VMs. If **Suspend** is selected in this field, no action will be applied to a Nutanix Acropolis VM when a session disconnect event occurs (a corresponding error will be recorded in the VDI Agent log). Since **Suspend** is the default action, you should consider selecting a different one if you are using Nutanix Acropolis.

Any modifications you make to default VM settings are immediately applied to all VMs in the current site that use them.

Assigning a guest VM to a user

You can assign a guest VM to a particular user making the VM persistent. To do so:

- 1 Select a VM in the **Guest VM List** dialog and then click **Tasks > Assign**.
- 2 In the dialog that opens specify a user. Please note that a guest VM can only be assigned to one user and a user can only have one assigned VM (1 to 1 ratio).
- 3 Click **OK** to create an assignment and close the dialog.

To remote a user assignment from a guest VM, right-click it and choose **Unassign**. This will remove the assignment and make the guest VM non-persistent.

You can also manage guest VM persistence on the **Persistent Guest VMs** tab page (p. 90).

Using a Wildcard to Filter VMs

Use the **Wildcard** input field at the bottom of the **Pool management** tab to specify a wildcard to indicate which guest VMs should be available for users. If a VM name matches the wildcard, it will be available. If not, the users will not be able to use it. Use the the asterisk operator (*) to specify a wildcard (e.g. **ABC***, ***ABC***).

Persistent Guest VMs

A persistent guest VM is a VM that is assigned to a particular user. When you publish a resource from a guest VM, you can select the **Persistent** option, in which case a VM is assigned to the first user who launches the resource from it. See **Publishing an Application from a Guest VM** (p. 92) for an example of the **Persistent** option (other types of resource also have it).

To view persistent guest VMs:

- 1 In the Parallels RAS Console, navigate to **Farm / VDI Hosts**.
- 2 Select the **Persistent Guest VMs** tab page in the right pane.

The **Persistent Guest VMs** list contains guest VMs, each of which is currently assigned to some user. The information includes the user name, guest VM name, pool name, VDI host, last time a VM was used, etc.

You can remove persistence from a guest VM by doing one of the following:

- Select a guest VM on the **Persistent Guest VMs** tab page and then click **Tasks > Delete**.
- Use the **Auto remove persistence if guest VM was not used for** drop-down menu to define an automatic removal rule. In the menu, select the time period after which persistence should be automatically removed. You can also type any desired time period, such as "1 week 3 days".

Publishing from a Guest VM

This section describes how to publish resources hosted by a guest VM. The publishing functionality described here is accessed from the **Publishing** category in the RAS Console.

Read on to learn how to publish resources from a guest VM.

Publishing a Desktop from a Guest VM

To publish a virtual desktop from a guest VM or guest VM clone, follow the below procedure:

- 1 In the RAS Console, select the **Publishing** category and click the **Add** icon below the **Published Resources** tree. This will launch the publishing wizard.
- 2 In the first step of the wizard select **Desktop** and click **Next**.
- 3 On the **Select Desktop Type** page, select **Guest VM Desktop** and click **Next**.
- 4 On the **Guest VM Desktop** page, enter a desktop name, an optional description, and change the icon if needed.
- 5 In the **Guest VM settings** section, specify from where the desktop should be published. First, you need to select an option in the **Connect to** drop-down list and then specify an additional parameter in the field below it as follows:
 - **Any guest VM.** Use the **from Pool** drop-down list to specify a pool.
 - **Specific guest VM.** To select a guest VM, expand the **Guest** drop-down list. This opens the **Guest VM List** dialog. Please note that in order to select a guest VM, it must have RAS Guest Agent installed. To verify this, look at the **Agent Status** column, which should say "Agent Verified". If you select a guest VM that has any other value in the **Agent Status** column, you will be asked to install the RAS Guest Agent in the VM before you can proceed (note that if the selected guest VM was stopped, it will be automatically started).
 - **Guest VM.** Specify the pool in the **from Pool** drop-down list and then specify **where name equals** Username or IP.
 - **Specific RAS Template.** Select a template by expanding the RAS Template drop-down list.

- 6 Select the **Persistent** option to mark a guest VM as persistent the first time a user connects to it.
- 7 In the **Desktop Size** section, specify the desktop screen resolution and size.
- 8 Click **Finish** when done.

Publishing an Application from a Guest VM

To publish an application from a guest VM or guest VM clone:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Application** and click **Next**.
- 3 On the **Select Server Type** page, select **Guest VM** and click **Next**.
- 4 On the **Select Application Type** page, select **Single application** and click **Next**. The **Application** page opens.
- 5 Enter a name and an optional description.
- 6 In the **Run** drop-down menu, specify if the application should run in a normal window, maximized, or minimized.
- 7 In the **Target** field, specify the application that you want to publish. You may click the [...] button to browse for it.
- 8 In the **Start in** field, specify (or browse for) the "start in" folder. Use Windows environment variables if you are manually entering the path.
- 9 (Optional) In the **Parameters** input field, specify the parameters to pass to the application when it starts.
- 10 In the **Guest VM settings** section, specify from where the application should be published. First, you need to select an option in the **Connect to** drop-down list and then specify an additional parameter in the field below it, as explained below:
 - **Any guest VM.** Use the **from Pool** drop-down list to specify a pool.
 - **Specific guest VM.** To select a guest VM, expand the **Guest** drop-down list. This opens the **Guest VM List** dialog. Please note that in order to select a guest VM, it must have RAS Guest Agent installed. To verify this, look at the **Agent Status** column, which should say "Agent Verified". If you select a guest VM that has any other value in the **Agent Status** column, you will be asked to install the RAS Guest Agent in the VM before you can proceed (note that if the selected guest VM was stopped, it will be automatically started).
 - **Guest VM.** Specify the pool in the **from Pool** drop-down list and then specify **where name equals** Username or IP.
 - **Specific RAS template.** Select a template by expanding the RAS Template drop-down list.
- 11 Select the **Persistent** option to mark a guest VM as persistent the first time a user connects to it.

12 When done, click **Finish** to publish the application.

Publishing a Web Application from a Guest VM

A web application is like any other application that you can publish using the standard application publishing functionality. However, to simplify publishing of straight URL links to web applications, a separate publishing item type is available that allows you to accomplish this task with minimal number of steps.

To publish a web application:

- 1** In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2** On the **Select Item Type** wizard page, select **Web application** and click **Next**.
- 3** On the **Select Server Type** page, select **Guest VM** and click **Next**.
- 4** On the **Virtual Desktop Web Application** wizard page that opens, specify the web application name, description, window state, and the URL. Select the **Force to use Internet Explorer** option if needed. To browse for a specific application icon, click **Change Icon**.
- 5** Use the **Guest VM settings** section to specify from where the application should be published.

The options are:

- **Any guest VM.** Publish the application from any guest VM in the selected pool. Select this option and then select a pool in the **from Pool** drop-down list.
- **Specific guest VM.** To select a guest VM, expand the **Guest** drop-down list. This opens the **Guest VM List** dialog. Please note that in order to select a guest VM, it must have RAS Guest Agent installed. To verify this, look at the **Agent Status** column, which should say "Agent Verified". If you select a guest VM that has any other value in the **Agent Status** column, you will be asked to install the RAS Guest Agent in the VM before you can proceed (note that if the selected guest VM was stopped, it will be automatically started).
- **Guest VM.** Select this option and then select a pool in **from Pool**. In the **where name equals** drop-down list, select **Username** or **IP**. The application will be published from a guest VM from the selected pool whose name/IP matches the username/IP of the user connecting.
- **Specific RAS template.** Publish the application from a specific RAS template. Select this option and then select a template in the **RAS template** drop-down list.

Select the **Persistent** option to mark a guest VM as persistent the first time a user connects to it.

- 6** When done, click **Finish** to publish the application.

Publishing a Network Folder from a Guest VM

You can publishing a filesystem folder via UNC path to open in Windows explorer. To minimize the number of configuration steps, a special publishing item is available that allows you to publish a network folder from a guest VM.

To publish a network folder:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Folder on the file system** and click **Next**.
- 3 On the **Select Server Type** page, select **Guest VM** and click **Next**.
- 4 On the **Virtual Desktop UNC Folder** wizard page, specify the usual application properties.
- 5 In the **UNC path** field, enter the UNC path of the folder you wish to publish. Click the **[...]** button to browse for a folder (it may take some time for the **Browse for Folder** dialog to open).
- 6 In the **Guest VM settings** section, specify from where the virtual desktop should be published. First, you need to select an option in the **Connect to** drop-down list and then specify an additional parameter in the field below it, as explained below:
 - **Any guest VM**. Use the **from Pool** drop-down list to specify a pool.
 - **Specific guest VM**. To select a guest VM, expand the **Guest** drop-down list. This opens the **Guest VM List** dialog. Please note that in order to select a guest VM, it must have RAS Guest Agent installed. To verify this, look at the **Agent Status** column, which should say "Agent Verified". If you select a guest VM that has any other value in the **Agent Status** column, you will be asked to install the RAS Guest Agent in the VM before you can proceed (note that if the selected guest VM was stopped, it will be automatically started).
 - **Guest VM**. Specify the pool in the **from Pool** drop-down list and then specify **where name equals** Username or IP.
 - **Specific RAS template**. Select a template by expanding the RAS Template drop-down list.
- 7 Select the **Persistent** option to mark a guest VM as persistent the first time the user connects to it.
- 8 Click **Finish** to publish the folder and close the wizard.

When published, the network folder will appear in the **Publishing > Published resources list**, just like any other application. To view its properties, select it and then click the **Virtual Desktop Application** tab:

- The **Target** property will always be set to `PublishedExplorer.exe`. This binary is created automatically (via agents pushing) and is simply a copy of the standard `explorer.exe` executable.
- The **Parameters** property specifies the network folder that we want to publish. The folder path can be in any format that the `explorer.exe` can handle.

Publishing a Document from a Guest VM

To publish a document from a guest VM or guest VM clone:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Document** and click **Next**.
- 3 Select **Guest VM** and click **Next**.
- 4 Specify the content type of the document you want to publish. You can select the content type from the predefined list or specify a custom content type in the **Custom content types** input field.
- 5 Click **Next**.
- 6 On the **Virtual Desktop Application** page, enter a name, an optional description, a Window state, and an icon if needed.
- 7 Use the [...] button next to the **Target** input field to browse for the document. All other fields will be automatically populated. To edit any of the auto populated fields, highlight them and enter the required details.
- 8 (Optional) In the **Parameters** input field, specify the parameters to pass to the application when it starts.

Note: Use the **Server(s)** drop down list to specify different document settings for a specific server in case the document is configured differently on that particular server. The settings will be saved for each server you select individually.

- 9 In the **Guest VM settings** section, specify from where the virtual desktop should be published. First, you need to select an option in the **Connect to** drop-down list and then specify an additional parameter in the field below it, as explained below:
 - **Any guest VM.** Use the **from Pool** drop-down list to specify a pool.
 - **Specific guest VM.** To select a guest VM, expand the **Guest** drop-down list. This opens the **Guest VM List** dialog. Please note that in order to select a guest VM, it must have RAS Guest Agent installed. To verify this, look at the **Agent Status** column, which should say "Agent Verified". If you select a guest VM that has any other value in the **Agent Status** column, you will be asked to install the RAS Guest Agent in the VM before you can proceed (note that if the selected guest VM was stopped, it will be automatically started).
 - **Guest VM.** Specify the pool in the **from Pool** drop-down list and then specify **where name equals** Username or IP.
 - **Specific RAS template.** Select a template by expanding the RAS Template drop-down list.
- 10 Select the **Persistent** option to mark a guest VM as persistent the first time the user connects to it.
- 11 Click **Finish** to publish the document.

Viewing VDI Host Summary

In addition to the VDI Hosts editor described in this chapter, you can also see the summary about the available VDI Host servers. To do so:

- 1 In the RAS Console, select the **Farm** category and then select the **Site** node in the middle pane.
- 2 The available servers are displayed in the **VDI Hosts** group in the right pane.
- 3 To go to the VDI Hosts editor, right-click a server and choose **Show in the Editor**.

For additional info, see **Viewing Sites in the RAS Console** (p. 33).

Managing VDI Sessions

The **Sessions** tab page allows you to view and manage current VDI sessions. To view the page, navigate to **Farm / Site / VD Hosts / Sessions**.

The **Sessions** lists displays current sessions and includes the following info for each session:

- **Guest VM.** Guest VM name.
- **User.** Session owner.
- **State.** Session state: **Idle**, **Active**, **Disconnected**.
- **Logon Time.** Last date and time the user logged on.
- **Session Length.** Total sessions duration.
- **Resolution.** Client display resolution.
- **Color Depth.** Client display color depth.
- **Device Name.** Client device name.
- **IP Address.** Client IP address.

You can sort the list by any session property. Simply click on a desired column heading to sort the list in ascending or descending order.

You can also filter the list using a single or multiple session properties as a criteria. To do so, click the magnifying glass icon (top right) and then type a desired string in a desired column. The list will be filtered as you type.

To manage a session (or multiple sessions at the same time), select one or more sessions and then use the **Tasks** drop-down menu to choose from the following actions:

- **Refresh.** Refresh the list.
- **Disconnect.** Disconnect the selected session(s).
- **Log Off.** Log off the session(s).
- **Send Message.** Opens the **Send Message** dialog where you can type and send a message to the session owner(s).

CHAPTER 7

Remote PCs

In addition to RD Session Hosts and VDI hosts, resources can also be published from a remote PC running a supported version of Windows. A remote PC can be a physical box or a virtual machine treated as a standalone computer, but typically they are physical computers. If you have virtual machines on your network, it makes sense to use them as part of the VDI infrastructure as was described in the **VDI Hosts** chapter (p. 68). However, if you don't need the guest VM cloning functionality or if your end users require full administrative permissions for customization, you can use a virtual machine as a remote PC. It's up to you.

This chapter describes how to add a remote PC to a site and how to publish remote applications and desktop from it.

In This Chapter

Adding a Remote PC	98
Installing Remote PC Agent Manually	99
Configuring a Remote PC.....	100
Viewing Remote PC Summary.....	102
Publishing from a Remote PC.....	102

Adding a Remote PC

Requirements to push install RAS Remote PC Agent on a PC

To push install the RAS Remote PC Agent on a PC, the following requirements must be met:

- The firewall must be configured on the server to allow push installation. Standard SMB ports (139 and 445) need to be open. See also **Port Reference** (p. 252) for the list of ports used by Parallels RAS.
- SMB access. The administrative share (\\server\\c\$) must be accessible. Simple file sharing must be enabled.
- Your Parallels RAS administrator account must have permissions to perform a remote installation on the PC. If it doesn't, you'll be asked to enter credentials of an account that does.
- The PC should be joined to an AD domain. If it's not, the push installation may not work and you will have to install the Agent on it manually. Please see **Installing Remote PC Agent Manually** (p. 99).

Add a Remote PC to the farm

Follow the below procedure to add a remote PC to the farm:

- 1 In the RAS Console, select the **Farm** category and click the **Remote PCs** node in the navigational tree.
- 2 Click **Add** in the **Tasks** drop-down menu to launch the setup wizard.
- 3 Specify the IP address or FQDN of a remote PC. Click the Get MAC button to obtain the PC's MAC address.
- 4 Click **Next**.
- 5 In this step, the Parallels RAS checks if the Remote PC Agent is installed on the specified PC. If it's not installed, click **Install** to push install the agent on the PC. If the push installation of Remote PC Agent fails for any reason, you can install it manually. See **Installing Remote PC Agent Manually** for details (p. 99).
- 6 Click **Add** to add the Remote PC to the Parallels Remote Application Server server farm.

Installing Remote PC Agent Manually

You may need to install the Remote PC Agent manually if the automatic push installation cannot be performed for any reason.

Installing Remote PC Agent Manually

- 1 Log into the PC where the Remote PC Agent is to be installed using an administrator account and close all other applications.
- 2 Copy the Parallels Remote Application Server installation file (**RASInstaller.msi**) to the PC and double click it to launch the installation.
- 3 Once prompted, click **Next** and accept the End-User license agreement.
- 4 Specify the path where the Remote PC Agent should be installed and click **Next**.
- 5 Select **Custom** and click **Next**.
- 6 Click on the **Remote PC Agent** and select **Entire Feature will be installed on local hard drive** from the drop down menu.
- 7 Ensure that all other components are deselected and click **Next**.
- 8 Click **Install** to start the installation. Click **Finish** once the installation is finished.

Remote PC Agent does not require any configuration. Once the agent is installed, select the Remote PC name in the Parallels RAS Console and click **Troubleshooting > Check Agent**. If the agent is installed properly, the status should change to **Agent Installed**.

Uninstalling Remote PC Agent

To uninstall Remote PC Agent from a server:

- 1 Navigate to **Start > Control Panel > Programs > Uninstall a Program**.
- 2 Find **Parallels Remote Application Server** in the list of installed programs.
- 3 If you don't have any other Parallels RAS components on the server that you want to keep, right-click **Parallels Remote Application Server** and then click **Uninstall**. Follow the instructions to uninstall the program. You may skip the rest of these instructions.
- 4 If you have other RAS components that you want to keep on the server, right-click **Parallels Remote Application Server** and then click **Change**.
- 5 Click **Next** on the Welcome page.
- 6 On the **Change, repair, or remove** page, select **Change**.
- 7 On the next page, select **Custom**.
- 8 Select **Remote PC Agent**, then click the drop-down menu in front of it, and click **Entire feature will be unavailable**.
- 9 Click **Next** and complete the wizard.

Configuring a Remote PC

To access the properties of a Remote PC, highlight the computer in the navigation tree and click **Tasks > Properties**. This opens the **Remote PC Properties** dialog.

The Properties Tab Page

By default, a PC is enabled in the farm. When it is disabled, published applications and virtual desktops cannot be served from it. To enable or disable a PC in the farm, select or clear the **Enable Remote PC** option.

If the IP or MAC address of a remote PC has changed, modify them using the **Remote PC** and **MAC Address** input fields.

The **Change Direct Address** option allows you to specify an IP address that Parallels Client can use to connect to the PC directly. This address is only used in the Direct Connection mode and it could be an internal or external IP address.

Note: The Wake On Lan option should be enabled in BIOS so the machine could be automatically turned on. If you are using a virtual machine, the option is usually supported by a hypervisor natively or via a 3rd party software. To test if the Wake On Lan option is turned on, close the **Remote PC Properties** dialog and then click the **Test Wake on LAN** button, which is located below the **Remote PCs** list.

The Agent Settings Tab Page

Each Remote PC in the farm has a RAS Remote PC Agent installed to provide a connection between the Parallels Remote Application Server and the PC. The agent can be configured on the **Agent Settings** tab page.

- **Port.** Specify a different remote desktop connection port number if needed.
- **Connection Timeout.** Select the desired Remote PC connection timeout value.
- **Publishing Session Timeout.** Specify the amount of time each session remains connected in the background after the user has closed the published application. This option is used to avoid unnecessary reconnections with the PC.
- **Allow Client URL/Mail Redirection.** Enable this option to allow http and mailto links to be opened using a local application on the client computer, rather than the server's resources. To configure a list of URLs which should be excluded, in the RAS Console, navigate to **Farm / Site / Settings** and click the **URL Redirection** tab.
- **Preferred Publishing Agent.** Select a Publishing Agent with which the Remote PC Agent should communicate. This can be helpful when site components are installed in multiple physical locations communicating through WAN. You can decrease network traffic by specifying a more appropriate Publishing Agent.
- **Allow file transfer command.** Allows you to enable or disable the remote file transfer functionality. For more information, see **Enabling or Disabling Remote File Transfer** (p. 206).
- **Allow local to remote drag and drop.** Enables the drag and drop functionality in a remote application. When this option is enabled, an end user can drag and drop files to a remote application on their local device. For example, a user can drag and drop a file to the Acrobat reader to open a PDF file. Or a user can drag and drop a file to Windows Explorer, which runs remotely, etc.

Note: at the time of this writing, the drag and drop functionality is only supported on Parallels Client for Windows and Parallels Client for Mac.

Configuring RDP Printing for Remote PC

The **RDP Printer** tab allows you to configure the renaming format of redirected printers. The format may vary depending on which version and language of the server you are using.

Set your RDP Printer Name Format specifically for the configured server by choosing any of the below options from the RDP Printer Name Format drop down menu:

- Printername (from Computername) in Session no.
- Session no. (computername from) Printername
- Printername (redirected Session no)

The other RDP Printing options available in the RDP Printer tab are:

- Remove session number from printer name

- Remove client name from printer name

Viewing Remote PC Summary

In addition to the Remote PCs editor described in this chapter, you can also see the summary about the available Remote PCs. To do so:

- 1 In the RAS Console, select the **Farm** category and then select the **Site** node in the middle pane.
- 2 The available servers are displayed in the **Remote PCs** group in the right pane.
- 3 To go to the Remote PCs editor, right-click a server and choose **Show in the Editor**.

For additional info, see **Viewing Sites in the RAS Console** (p. 33).

Publishing from a Remote PC

This section describes how to publish resources hosted by a standalone remote PC. The publishing functionality described here is accessed from the **Publishing** category in the RAS Console.

Read on to learn how to publish resources from a remote PC.

Publishing a Desktop from a Remote PC

To publish a desktop from an RD Session Host:

- 1 In the RAS Console, select the **Publishing** category and click the **Add** icon below the **Published Resources** tree. This will launch the publishing wizard.
- 2 In the first step of the wizard select **Desktop** and click **Next**.
- 3 On the **Select Desktop Type** page, select **Remote Desktop PC** and click **Next**. The **Remote PC Desktop** page opens.
- 4 Specify a name, an optional description, and change the icon if needed.
- 5 Click the [...] button next to the **Selected Remote PC** field to specify from which remote PC the desktop should be published. In the box that opens, double-click a PC to select it.
- 6 Select the desired **Desktop Size** properties.
- 7 Click **Finish** to publish the desktop.

Publishing an Application from a Remote PC

To publish an application from a remote PC:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Application** and click **Next**.
- 3 On the **Select Server Type** page, select **Remote PC** and click **Next**.
- 4 On the **Select Application Type** page, select **Single Application** and click **Next**. The **Remote PC Application** page opens.
- 5 Enter a name and an optional description.
- 6 In the **Run** drop-down menu, specify if the application should run in a normal window, maximized, or minimized.
- 7 In the **Target** field, specify the application that you want to publish. You may click the [...] button to browse for it.
- 8 In the **Start in** field, specify (or browse for) the "start in" folder. Use Windows environment variables if you are manually entering the path.
- 9 (Optional) In the **Parameters** input field, specify the parameters to pass to the application when it starts.
- 10 Click the [...] button in the **Remote PC Settings** section to select a remote PC from which the application should be published. In the box that opens, double-click a PC to select it.
- 11 Select the **Persistent** option to mark a guest VM as persistent the first time the user connects to it.
- 12 When done, click **Finish** to publish the application.

Publishing a Web Application from a Remote PC

A web application is like any other application that you can publish using the standard application publishing functionality. However, to simplify publishing of straight URL links to web applications, a separate publishing item type is available that allows you to accomplish this task with minimal number of steps.

To publish a web application:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Web Application** and click **Next**.
- 3 On the **Select Server Type** page, select **Remote PC** and click **Next**.
- 4 On the **Remote PC Web Application** wizard page that opens, specify the web application name, description, window state, and the URL. Select the **Force to use Internet Explorer** option if needed. To browse for a specific application icon, click **Change Icon**.

- 5 In the **Remote PC Settings** section, click the [...] button to select a remote PC.
- 6 Click **Finish** to publish the application.

Publishing a Network Folder from a Remote PC

You can publishing a filesystem folder via UNC path to open in Windows explorer. To minimize the number of configuration steps, a special publishing item is available that allows you to publish a network folder from a PC.

To publish a network folder:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Folder on the file system** and click **Next**.
- 3 On the **Select Server Type** page, select **Remote PC** and click **Next**.
- 4 On the **Remote PC UNC Folder** wizard page, specify the usual application properties.
- 5 In the **UNC path** field, enter the UNC path of the folder you wish to publish. Click the [...] button to browse for a folder (it may take some time for the **Browse for Folder** dialog to open).
- 6 In the **Remote PC Settings** section, select the [...] button and then select a remote PC from the list.
- 7 Click **Finish** to publish the folder and close the wizard.

Publishing a Document from a Remote PC

To publish a document from a remote PC clone:

- 1 In the RAS Console, select the **Publishing** category and then click the **Add** icon below the **Published Resources** tree (or right-click inside the **Published Resources** box and click **Add** in the context menu). This will launch the publishing wizard.
- 2 On the **Select Item Type** wizard page, select **Document** and click **Next**.
- 3 Select **Remote PC** and click **Next**.
- 4 Specify the content type of the document you want to publish. You can select the content type from the predefined list or specify a custom content type in the **Custom content types** input field.
- 5 Click **Next**.
- 6 On the **Remote PC Application** page, enter a name, an optional description, a desired window state, and an icon if needed.
- 7 Use the [...] button next to the **Target** input field to browse for the document. All other fields will be automatically populated. To edit any of the auto populated fields, highlight them and enter the required details.

- 8 (Optional) In the **Parameters** input field, specify the parameters to pass to the application when it starts.
- 9 Click the [...] button in the **Remote PC Settings** sections to browse for a remote PC from which the document should be published. In the box that opens, double-click a PC to select it.
- 10 Click **Finish** to publish the document.

CHAPTER 8

Managing Published Resources

Publishing is one of the fundamental features of Parallels Remote Application Server. The resources that you can publish include:

- Applications
- Containerized applications
- Desktops
- Documents
- Web applications
- Network folders

We've already discussed how to publish resources from various types of servers. You can find this information using the following links:

- **Publishing from an RD Session Host** (p. 58)
- **Publishing from a Guest VM** (p. 91)
- **Publishing from a Remote PC** (p. 102)

This chapter describes management tasks that you can perform on resources that have been already published.

In This Chapter

General Management Tasks	106
Manage Published Applications.....	108
Manage Published Desktops.....	111
Manage Published Documents.....	112
Manage Folders	114
Using Filtering Rules	116
Checking Effective Access	118
Specifying Client Settings	119
Quick Keypad.....	120

General Management Tasks

To view published resources, select the **Publishing** category in the Parallels RAS Console. In the middle pane, expand the **Published Resources** node (if it's collapsed) to see the resources.

Right-click a resource to open a context menu. The menu has the following options:

- **Add.** Starts the publishing wizard, which you can use to publish a resource.
- **New Folder.** Allows you to add a folder to the **Published Resources** tree. Folders are described in the **Manage Folders** section (p. 114).
- **Find.** Allows you to search the list for a resource by name.
- **Duplicate.** Duplicates a selected resource. You can publish multiple resources of the same type, but configure them differently according to your needs.
- **Disable** or **Enable.** Disables or enables a selected resource. A disabled resource is unavailable to end users.
- **Delete.** Deletes a published resource from the Parallels RAS farm. This only removes the published resource item from the farm. The actual application is not affected. To avoid accidental deletions, a dialog box is displayed asking for your confirmation.
- **Verify Target(s).** Verifies that the target specified for the selected resource is valid. To see the target, select a resource and then click the **Application** tab page.
- **Convert Filters to Secure Identifiers.** If filtering for a resource is specified using WinNT or LDAP, you can use this option to convert it to SID (Secure Identifier). For more information, see **Using Filtering Rules** (p. 116).
- **Running Instances.** Opens the **Running Processes** dialog. For more information about the dialog, please see **Managing Sessions > Managing running processes** (p. 55). When the dialog is opened, a filter is applied to the process list to include only the processes for the selected published resource (a resource ID is used as a value). You can further filter the list to include only the process for a particular user (the **Username** column).

The action items at the bottom of the screen allow you to perform the following actions:

- **Add.** Same action as the **Add** menu item described above.
- **New Folder.** Same action as the **New Folder** menu item described above.
- **Delete.** Same as the **Delete** menu item described above.
- **Move Up.** Moves a selected published resource item up the list.
- **Move Down.** Moves a selected published resource item down the list.
- **Disable.** Same as the **Disable** menu item described above.
- **Sort.** Sorts resources alphabetically. For this action item to become enabled, you must select the **Published Resources** node (the topmost one) or a folder containing individual items.
- **Find.** Same as the **Find** menu item described above.
- **Running Instances.** Same as the **Running Instances** menu item described above.
- **Effective Access.** Allows you to view which published resources are available for a specific user. For complete details, see **Checking Effective Access** (p. 118).

After making any changes to published resources, please don't forget to click the **Apply** button to commit them to the Parallels RAS farm.

Manage Published Applications

Publishing an application

Publishing an application has been discussed earlier in this guide in the following sections:

- **Publishing an Application from an RD Session Host** (p. 59)
- **Publishing an Application from a Guest VM** (p. 92)
- **Publishing an Application from a Remote PC** (p. 102)

Configuring a published application

When publishing an application using a wizard, you specify multiple application parameters such as name, executable path, etc. You can modify these options after the application has been published.

To modify a published application:

- 1** In the RAS Console, select the **Publishing** category and then select the application in the **Published Resources** tree.
- 2** Use the tab pages in the right pane to change the application options as described in the following subsections.

Configuring from which servers the application is published

You can specify the RD Session Hosts from which an application is published on the **Publish From** tab page. The following options are available:

- **All Servers in Site.** The application will be published from all servers on which it is installed.
- **Server Groups.** Select this option and then select one or more RD Session Host groups from which the application should be published.
- **Individual Servers.** Select this option and then select one or more individual RD Session Hosts.

Configuring server-specific application settings

The **Application** tab page displays application- and server-specific settings.

You can modify the basic application settings (name, description, etc.) as needed. Select the **Start automatically when user logs on** option to start an application as soon as a user logs on. This option works on desktop versions of Parallels Client only.

The **Server Settings** section contains server-specific options that you can configure. If an application was published from multiple servers, the **Server(s)** drop-down list can be used to select individual servers and set Target, Start in, and Parameters values for a particular server. As an example, you should do this when different servers have the application installed in different folders, so that the **Target** and **Start in** field values would be valid on each server.

To save the currently displayed server settings as default, click the **Save as Default Settings** button. To apply the saved default settings to a server, click the **Use Default Settings** button. These two buttons give you the flexibility of using custom settings or defaults in different server configuration scenarios. Please note that when you save settings as default, Parallels RAS will check if this site has applications with per-server settings and will display a message asking if you would like those servers to use the new default settings. If you say, "No", the servers will keep their unique settings. The defaults will still be saved.

To verify that the specified **Target** and **Start In** values are correct for all servers, click the **Verify Target(s)** button. The **Target Verifier** dialog opens listing each server and the verification status in the **Progress** column. If the application is installed at a different path on one of the servers, the **Progress** column will indicate an error. In such a case, close the **Target Verifier** dialog and then select the server in the **Server(s)** drop-down list. Specify new values in the **Target**, **Start In**, and (if necessary) **Parameters** fields specific for that server. Click **Apply** to save your changes.

The **Target Verifier** dialog can also be used to verify the targets for all published applications at once. To do so, right-click **Published Resources** (the root node of the **Published Resources** tree) and then click **Verify Target(s)** in the context menu. This time, the **Target Verifier** dialog will contain all published applications and their verification status.

The **Quick Keypad** section at the bottom of the **Application** tab page allows you to select a Quick Keypad template that should be assigned to this application. The **Quick Keypads** link below the drop-down list takes you to the **Quick Keypad** category in the console where you can configure Quick Keypad templates. If you don't see the **Quick Keypad** section, try to maximize the console window. For more information, please see the **Quick Keypad** section (p. 120).

To replicate the currently selected application settings to all sites, select the **Replicate settings** option in the lower right-hand corner. This will make the default application settings on every site to be the same as the displayed settings. If some of the servers on other sites use server-specific settings (not defaults), you will see a message asking if you would like those servers to use the default settings. If you select "No", the servers will keep their unique settings. The default settings will still be synchronized with the selected application settings.

Configuring shortcut options for a published application

Note: This option is not available on all operating systems.

Click the **Shortcuts** tab to enable the creation of shortcuts on the user's desktop, in the Start folder, and shortcut in the Auto Start folder. When the **Auto Start** shortcut option is selected, the application will be started when the operating system on the client is started.

To use the default settings, select the **Inherit default settings** option. You can view or modify the default settings by clicking the **Edit Defaults** link.

Configuring file extension associations

To modify file extension association for a particular published application, click the **File Extensions** tab.

A list of typically associated file extensions is automatically generated once an application is published. If you would like to modify the preconfigured list and add, remove, or modify an existing entry, select the **Associate File Extensions** option. To add a new extension to the list, click **Add** in the **Tasks** drop-down menu (or click the + icon) and specify the desired extension.

To modify an existing association, highlight the extension and click **Properties** in the **Tasks** drop down menu (or double-click the **Parameters** column) and type the parameter.

Configuring licensing options for published applications

Click the **Licensing** tab to configure the following licensing options:

- **Disable session sharing.** If this option is enabled, it allows you to isolate the published application to one session. Therefore if the same application is launched twice, the two instances of the application will run in two isolated sessions.
- **Allow users to start only one instance of the application.** If this option is enabled, a user can only launch a single instance of the application.
- **Concurrent Licenses.** Use this option to specify the maximum number of concurrent instances the application can run. E.g. if the license of the application allows you to only run 10 instances of the application, set the Concurrent licenses option to 10 so once such limit is reached, other users cannot initiate other instances.
- **If limit is exceeded.** From this drop down menu you can specify what action should the Parallels Remote Application Server take in case any of the above licensing configured limits are exceeded.

To use the default settings, select the **Inherit default settings** option. You can view or modify the default settings by clicking the **Edit Defaults** link.

Configuring display settings for a published application

Click the **Display** tab to configure the color depth of the published application, resolution, width and height. To use the default settings, select the **Inherit default settings** option. You can view or modify the default settings by clicking the **Edit Defaults** link.

Filtering

Filtering is comprehensively described in the **Filtering Rules by User, Client, MAC, and Gateway** section (p. 116).

Manage Published Desktops

Publishing a desktop

Publishing a remote desktop has been discussed earlier in this guide in the following sections:

- **Publishing a Desktop from an RD Session Host** (p. 58)
- **Publishing a Virtual Desktop from a Guest VM** (p. 91)
- **Publishing a Desktop from a Remote PC** (p. 102)

Configuring a published desktop

When publishing a desktop using a wizard, you have to specify the desktop settings, such as display size, etc. You can modify these options after the desktop has been published.

To modify a published desktop, select it in the **Published Resources** tree in the **Publishing** category.

Configuring from which sites a published desktop is available

By default, a published desktop is available through all of the available sites. To restrict access to a specific site or a site group, select a desktop in the **Published Resources** tree and then click the **Sites** tab in the right pane. Select the sites from which the desktop should be available.

Note: For the **Sites** tab to be available, you need more than site in a farm.

Configuring from which RD Session Hosts a desktop is published

When configuring an RD Session Host desktop, you can specify from which servers it should be published. To do so, click the **Publish From** tab and select the desired servers.

Configuring desktop resolution and other properties

Depending on the desktop type, click the **Desktop**, **Remote PC Desktop**, or **Virtual Desktop** tab to configure the desktop name, description, icon, and resolution.

Start automatically when user logs on: Select this option if you want to open a desktop as soon as a user logs in.

Desktop Size: Select a desired desktop size from the drop-down list.

Multi-Monitor: Select whether the multi-monitor should be enabled, disabled, or whether the client settings should be used.

Configuring shortcut options for a published desktop

Click the **Shortcuts** tab to enable the creation of shortcuts on the user desktops, shortcuts in the Start folder, and shortcut in the Auto Start folder. When the Auto Start shortcut is enabled, the application will start when the user's computer is started.

Note: This option is not available on all operating systems.

The filtering tab

Filtering is comprehensively described in the **Filtering Rules by User, Client, MAC, and Gateway** section (p. 116).

Manage Published Documents

Publishing a document

Publishing a document has been discussed earlier in this guide in the following sections:

- **Publishing a Document from an RD Session Host** (p. 62)
- **Publishing a Document from a Remote PC** (p. 104)
- **Publishing a Document from a Guest VM** (p. 95)

Configuring a published document

When publishing a document using a wizard, you have to specify the document settings. These options can be modified after the document has been published.

To modify a published document, select it in the **Published Resources** tree in the **Publishing** category and then use the tab pages in the right pane to configure the published document settings.

Configuring from which sites a published document is available

By default, a published document is available through all available sites. To restrict access to a specific site or a site group, click the **Sites** tab in the right pane. Select the sites from which the document should be available.

Note: For the **Sites** tab to be available, you need more than one site in a farm.

Configuring from which servers a document is published

Click the **Publish From** tab and select the servers from which the document should be published. Please note that a server must have the application installed that can open this particular document type.

Configuring server-specific document settings

By default, the settings configured in the **Target** (application path), **Start In**, and **Parameters** fields apply to all servers a document is published from. If a document exists in a different folder on one (or more) of the servers, you can specify the above settings for a specific server or servers individually.

To do so:

- 1 Click the **Application** tab and.
- 2 Select a server in the **Server(s)** list.
- 3 Specify the **Target**, **Start In**, and **Parameters** (optional) properties. The values that you specify will apply to the selected server only. Repeat the steps for other servers if needed.
- 4 Click the **Verify Target(s)** button to verify the document path on all servers from which this application is published. The results are displayed in the **Target Verifier** dialog where you can see whether the target is correct or not for each server.

Configuring shortcut options for a published document

Click the **Shortcuts** tab to enable the creation of shortcuts on the user desktops, shortcuts in the **Start** folder and shortcut in the **Auto Start** folder. When the **Auto Start** shortcut is enabled, the application will start when the user's computer is started.

Note: This option is not available on all operating systems.

Configuring file extension associations

To modify file extension association for a particular published document, click the **File Extensions** tab.

Note: A list of typically associated file extensions is automatically generated once a document is published. If you would like to modify the preconfigured list, click the **Associate File Extensions** option.

To add a new extension to the list, click **Tasks > Add** and specify the extension

To modify the extension's parameters, highlight the extension and click **Tasks > Properties**.

Configuring licensing options for published documents

Click the **Licensing** tab to configure any of the below licensing options:

Select the **Inherit default settings** option to use the defaults. To specify your own settings, clear the option and set the following options:

- **Disable session sharing.** If this option is enabled, it allows you to isolate the published application to one session. Therefore if the same application is launched twice, the multiple instances of the application will run in the same isolated session.
- **Allow users to start only one instance of the application.** If this option is enabled, a user can only launch a single instance of the application.
- **Concurrent Licenses.** Use this option to specify the maximum number of concurrent instances the application can run. E.g. if the license of the application allows you to only run 10 instances of the application, set the Concurrent licenses option to 10 so once such limit is reached, other users cannot initiate other instances.
- **If limit is exceeded.** From this drop down menu you can specify what action should the Parallels Remote Application Server take in case any of the above licensing configured limits has been exceeded.

Configuring display settings for a published document

Click the **Display** tab to configure the color depth of the published document, resolution, width and height. If these options are left at their default values, the client-specified options will take over.

You can also enable the option to wait for the Universal Printers to be redirected before the application is loaded. When enabling this option, you can also configure the maximum wait time (in seconds) for the Universal Printers to be redirected.

Filtering

Filtering is comprehensively described in the **Filtering Rules by User, Client, IP, MAC and Gateway** section (p. 116).

Manage Folders

Folders are used to organize published resources and to facilitate filtering options.

There are two types of folders that you can create in the **Published Resources** tree in the Parallels RAS Console:

- **Folders for administrative purposes.** Folders of this type are intended for Parallels RAS administrators (users of the Parallels RAS Console). They are used to logically organize published resources in the Parallels RAS Console but they do not appear in the Parallels Client launchpad on user devices. These folders are used to help administrators manage published resources more efficiently.
- **Regular folders.** These folders are similar to administrative folders described above but they do appear in the launchpad on user devices. You normally use these folders to group published resources by type (e.g. office applications, specific business applications, utilities, etc.).

Creating a folder

To create a new folder:

- 1 In the RAS Console, select the **Publishing** category.
- 2 Right-click anywhere in the **Published Resources** tree and choose **New Folder** (or click the **[+] New Folder** icon at the bottom).
- 3 In the **Folder** dialog, specify a folder name and an optional description.
- 4 To make it a folder for administrative purposes, select the **Use for administrative purposes** option. To publish a regular folder, clear the option. See above for the explanation of the two folder types.
- 5 When creating a regular folder, you can change its icon by clicking the **Change icon** button. Administrative folders use a built-in icon that cannot be changed. Icons appear in the **Publishing** category in the Parallels RAS Console and in the Parallels Client launchpad (regular folders only).
- 6 Click **Finish** to create the folder.

Managing folders

To modify an existing folder:

- 1 Select a desired folder in the **Published Resources** tree.
- 2 The **Information tab** in the right pane displays the folder information (read-only).
- 3 On the **Folder** tab page, you can see and modify the folder name and description. You can also select or clear the **Use for administrative purposes** option to change the folder type (see above for an explanation). To change the folder icon, click the **Change icon** button. Note that the button is disabled if the **Use for administrative purposes** option is selected.
- 4 The **Filtering** tab page specifies filtering options. Once set, these options will be inherited by all published resources in that folder. For more information about filtering, please see **Using Filtering Rules** (p. 116).

Adding published resources to a folder

To add a published resource to a folder, click and hold the published resource in the **Published Resources** tree and then drag it to the desired folder.

Using Filtering Rules

Filtering is a feature that allows you to control who can access a particular published resource. You can define filtering rules based on any of the following:

- User
- Client (managed client)
- IP address
- MAC address
- Gateway

By default, no filtering rules exist for a published resource, therefore the resource is available to anyone who is connected to the Parallels RAS farm. Once you specify a filtering rule for a published resource, only those users/computers who satisfy the criteria will be able to use it.

To create a filtering rule, select a published resource in the **Published Resources** tree and click the **Filtering** tab. In the **Select Filtering Type** drop-down list, select a criteria and then define a filtering rule as described below.

Filtering by user

To allow individual users or a user group to access the published resource:

- 1** Select **User** in the **Search Filtering Type** drop down list.
- 2** Select the **Allow the following Users** option.
- 3** Click **Tasks > Add** and specify a user or a group in the **Select Users** dialog. Click **OK** to add a user/group to the list on the **Filtering** tab page.
- 4** In the **Default Object Type** drop-down list, select whether this rule will applies to users, groups, or both.
- 5** In the **Browse Mode** drop-down list, select the browsing mode you would like to use to connect to Active Directory or Windows.

The options are:

- **WinNT.** WinNT is faster than LDAP but does not support group nesting. Used only for backward compatibility.
- **LDAP.** LDAP supports group nesting but is slow. Used only for backward compatibility.
- **Secure Identifier.** This is the preferred and fastest method. It supports group nesting and renaming.

To convert users or groups specified using WinNT or LDAP, select a user entry and then click **Tasks > Convert**.

Filtering by client

To allow a specific client or a list of clients to access the published resource, follow these steps:

- 1** Select **Client** in the **Search Filtering Type** drop-down list.
- 2** Select the **Allow the following Clients** option. You can use the asterisk character (*) as a wildcard in a name. To include a wildcard in a name, select a client in the list and then click **Tasks > Edit**.
- 3** Click **Tasks** and choose one of the following:
 - **Add from network browse.** Opens a dialog where you can select a client from the list populated from the network.
 - **Add from Active Directory.** Opens a dialog where you can specify a computer or search the Active Directory for it.
 - **Add from known devices.** Opens a dialog where you can select a client from the list populated by previously connected clients.
 - **Add custom entry.** Allows you to type the name of a client. To modify the name, select it and then click **Tasks > Edit**.
 - **Edit.** Allows you to modify the name of a selected client. If you want to include a wildcard (*) in a name, you can do it using this option. If no client is selected in the list, the option is disabled.
 - **Delete.** Allows you to delete a selected client. If no client is selected in the list, the option is disabled.
- 4** Click **OK** to add your selection to the **Client** list.

Filtering by IP address

To allow a specific IP address (or multiple addresses) or a range of IP addresses to access the published resource, follow these steps:

- 1** In the **Search Filtering Type** drop-down list, select **IP Address**.
- 2** Select the **Allow the following IPs** option.
- 3** Click **Tasks > Add** in the IPv4 and/or IPv6 sections to specify the IP address or a range of IP addresses and click **OK**.

Filtering by MAC address

To allow a MAC address or a specific list of MAC addresses to access the published resource, follow these steps:

- 1** In the **Select Filtering Type** drop-down list, select **MAC**.
- 2** Select the **Allow the following MACs** option.
- 3** Click **Tasks > Add** to select the MAC address(es) and click **OK**.

Filtering by gateway

To allow users to connect to a published resource through a specific gateway, follow these steps:

- 1 Select the **Gateway** filtering type.
- 2 Select the **Allow connections from the following gateway** option.
- 3 Click **Tasks > Add** to specify the gateway and its IP address (if it has multiple IP addresses).

Configuring multiple filtering rules

If multiple filtering rules are configured for a specific published resource, the connecting user has to match ALL of them to be allowed access to the published resource.

Checking Effective Access

Filtering rules described in the previous section (p. 116) allow you to configure who can access a particular published resource. If a Parallels RAS user cannot see one or more published resources in Parallels Client, you would normally have to check filtering settings for each resource to make sure that it is published for a given user. The Effective Access functionality simplifies this task by allowing you to view in one place which published resources are available for a user and which are not.

To open the **Effective Access** dialog, select the **Publishing** category in the Parallels RAS Console and then click the **Effective Access** item in the toolbar at the bottom of the window (if you don't see the item, maximize the console window). You can also open the dialog by right-clicking anywhere in the **Published Resources** pane and choosing **Effective Access** in the context menu.

The **Effective Access** dialog allows you to specify a user (and optionally additional criteria) and then view published resources which this user is allowed to access. To choose a user, do one of the following:

- Type the user name in the **User** field, or click the [...] button next to it and use the **Select User or Group** dialog to select a user.
- Select a device owned by this user from the list of known devices. To do so, click the **Select a Device** button then select a device. Note that if a device has never been used to connect to this Parallels RAS farm, it will NOT be included in the list. For more information, see the **Monitoring Devices** section. (p. 182) After selecting a device, click **OK** to return to the **Effective Access** dialog. All of the fields will be automatically populated using properties of the selected device.

Once you specify a user, enter the additional criteria if needed (all fields except **User** are optional):

- **Client.** Client name assigned to a device. This could be a computer name, FQDN, or a custom name that the user could have set in Parallels Client.
- **IP Address.** Client IP address.

- **MAC.** Client MAC address.
- **Gateway.** RAS Secure Client Gateway name through which the client connects to the farm.

The **Manage groups** button allows you to preview how user access changes if the user is added to one or more groups. When you click the button:

- 1 The **Manage Groups** dialog opens listing groups to which the user already belongs.
- 2 Click the **[+]** button to add the user to one or more additional groups. Note that this will only be a simulation; the user will not be actually added to any additional group.
- 3 To remove a "simulated" group, select it in the lower pane and click the **[-]** button.
- 4 Click **Close** to return to the **Effective Access** dialog.

Finally, to view the effective access information for the specified user, click the **View** button. This opens the **Effective Access - Summary** dialog, which displays the following information:

- The left pane contains the complete list of resources published in the current site. To view only the resources that the specified user can access, select the **Show only allowed published resources** option. If the user is not allowed to access a resource, the resource name is highlighted in red.
- The right pane contains information whether the user is allowed to access a resource selected in the left pane and whether filtering is enabled for the selected resource. Additional information may include filtering details and extended group membership.

By looking through the resource list, you can see which resources the user can or cannot access and take appropriate actions if necessary. If needed, you can export the effective access information to a CSV file. To do so, click the **Export** button and specify a file name. The CSV file has the following columns:

- **Name.** Application name.
- **ID.** Application ID.
- **Accessible.** Whether the application is accessible to the user (Yes or No).
- **Rule.** Filtering rule. If no rules are configured for the application, the column will have no value.

Specifying Client Settings

To specify client settings for published resources, navigate to **Farm / Site / Settings** and select the **Client Settings** tab page. On this page, you can specify how published application icons are displayed on the client side.

Select icon resolution

Published resources are displayed in Parallels Client as icons or as a list. You can specify which resolution should be used when the resources are displayed as icons. Select from the following options:

- **Send standard resolution icons.** Standard resolution icons.
- **Send high resolution icons.** High resolution icons. Please note that this option will use more network bandwidth.

Enable or disable the overlay icon

Note: This option is applicable to desktop clients only (Windows, Mac, Linux). It has no effect on mobile and HTML5 clients.

The other option on this tab page is **Enable overlay icon**. An overlay icon is placed on a standard application icon to indicate that it's a remote application served by Parallels RAS. When you launch a remote application from Parallels Client, the application icon is displayed on the local desktop (e.g. on the taskbar in Windows or Dock in macOS). By using an overlay icon, you give the user the ability to tell at a glance which of their running applications are remote Parallels RAS applications and which are local (or any other kind).

Parallels RAS uses the Parallels logo as the overlay icon. When the overlay icon option is enabled, an application icon on a local computer will look like the following sample icons:

As you can see, these are standard icons used by the Windows Calculator and Paint applications with the Parallels logo icon (red parallel lines) in the corner. When a user notices the overlay, they'll know right away that this is a remote application served by Parallels RAS, not a local Windows app.

Quick Keypad

The **Quick Keypad** category in the Parallels RAS Console allows you to define custom keys to perform common actions in published applications running on mobile devices. Custom keys appear above the standard keyboard in iOS and Android and can be tapped just like any other key on the virtual keyboard.

This feature is designed for users who run published applications on a phone or a tablet. When a particular software requires repeated selection of certain menu or toolbar items, using custom keys can significantly improve user experience. For example, let's say a user has some data entry task which requires them to press **File > New** and **File > Save** menu items over and over again. If you define two custom keys to perform these actions, the user will see them above the standard keyboard in iOS or Android, so instead of tapping the application's native menu items (which can be cumbersome), they can tap these keys, which is much easier and quicker.

To define custom keys, select the **Quick Keypad** category in the Parallels RAS Console. The **Quick Keypads** view in the right pane allows you to create a Quick Keypad template. A template is created for a specific application (or a group of applications with the identical UI design) and contains shortcuts to perform common actions in an application. Once a template is created, you assign it to a published application or a group of applications, so each application (or a group) has its own Quick Keypad.

To create a Quick Keypad template:

- 1 Click the **Tasks** drop-down menu and choose **New Quick Keypad** (or click the **[+]** icon).
- 2 Specify a Quick Keypad template name (e.g. "Office apps").
- 3 You can organize a Quick Keypad using a multi-level menu system. If you want to do this, click the **New menu** item and specify the menu item name. You can add sub-menu items too. To move a menu item across the tree, simply drag and drop it to the desired tree node.
- 4 When you have your basic menu structure defined, you can add shortcuts (or you can do it any order you like).
- 5 To add a shortcut, click the **New shortcut** item.
- 6 In the **Label** field, enter the name (e.g. "New").
- 7 Click the **Shortcut** field and press a shortcut on the keyboard as you would in the target application. For example, the standard shortcut to create a new document in many applications is Ctrl+N, so to input this shortcut, you would press and hold Ctrl and then press N. The shortcut will appear in the field as "Ctrl+N". You can input up to three shortcuts in this field.
- 8 To add another shortcut to the template, click the **New shortcut** item again. Repeat until all desired shortcuts are defined.
- 9 Click **OK** to close the dialog. The new template will appear in the **Quick Keypads** list.

To modify the template, right-click it and choose **Properties**.

You now need to assign the template that you created to an application (or multiple applications). To do so:

- 1 Right-click a template and choose **Assign to Application** (you can also use the **Tasks** drop-down menu or click the "link" icon).
- 2 In the **Assign Quick Keypad Template** dialog, select one or more applications to which the template should be assigned.
- 3 Click **OK** when done.

When a remote user runs an application on their mobile device and opens a virtual keyboard, they will see the extra keys corresponding to shortcuts that you defined for a Quick Keypad template. Tapping a key will perform the corresponding action (e.g. Ctrl+N, which will open a new document).

Exporting and importing a Quick Keypad template

To easily move a Quick Keypad template from one Parallels RAS farm to another, use the Export and Import functionality. To export a template, right-click a template and choose **Export**. Specify the file name and location and click **Save**. To import a template, right-click on an empty space in the **Quick Keypads** list and choose **Import**. You can also perform these actions using the **Tasks** drop-down menu.

RAS Secure Client Gateways

RAS Secure Client Gateway tunnels all Parallels Remote Application Server data on a single port. It also provides secure connections and is the user connection point to Parallels Remote Application Server. At least one RAS Secure Client Gateway must be installed and configured in every site. Multiple gateways can exist depending on your requirements. Read this chapter to learn how to add, configure, and manage RAS Secure Client Gateways.

In This Chapter

RAS Secure Client Gateway Overview	123
Adding a RAS Secure Client Gateway	124
Manually Adding a RAS Secure Client Gateway	125
Checking the RAS Secure Client Gateway Status	125
Configuring RAS Secure Client Gateway	126
Gateway Tunneling Policies	134
Viewing Gateway Overview	134

RAS Secure Client Gateway Overview

By default, a RAS Secure Client Gateway is installed on the same server where Parallels Remote Application Server is installed. You can add additional RAS Secure Client Gateways to a site to support more users, load balance connections, and provide redundancy.

To manage RAS Secure Client Gateways, in the RAS Console, navigate to **Farm / Site / Gateways**. Use the tab pages in the left pane to manage **Gateways** and **Tunneling Policies**.

How a RAS Secure Client Gateway Works

The following describes how a RAS Secure Client Gateway handles user connection requests:

- 1 A RAS Secure Client Gateway receives a user connection request.
- 2 It then forwards the request to all of the available RAS Publishing Agents in the farm.
- 3 A RAS Publishing Agent performs Load Balancing checks and an Active Directory security lookup to obtain security permissions.
- 4 If the user requesting a published resource has sufficient rights, the RAS Publishing Agent sends a response to the gateway which includes details about the RD Session Host the user can connect to.

- 5 Depending on the connection mode, the client either connects through the gateway or disconnects from it and then connects directly to the RDS server.

RAS Secure Client Gateway Operation Modes

RAS Secure Client Gateway can operate in one of the following modes:

- **Normal Mode.** A RAS Secure Client Gateway in normal mode receives user connection requests and checks with the RAS Publishing Agent if the user making the request is allowed access. Gateways operating in this mode can support a larger number of requests and can be used to improve redundancy.
- **Forwarding Mode.** A RAS Secure Client Gateway in forwarding mode forwards user connection requests to a preconfigured gateway. Gateways in forwarding mode are useful if cascading firewalls are in use, to separate WAN connections from LAN connections and make it possible to disconnect WAN segments in the event of issues without disrupting the LAN.

Note: To configure the forwarding mode, a Parallels RAS farm must have more than one RAS Secure Client Gateway.

Adding a RAS Secure Client Gateway

To add a RAS Secure Client Gateway to a site, follow these steps:

- 1 In the RAS Console, navigate to **Farm / Site / Gateways**.
- 2 With the **Gateways** tab selected in the right pane, click **Tasks > Add** to start the **Add RAS Secure Client Gateway** wizard.
- 3 Enter the server FQDN or IP address (or click the [...] button to select a server from the list).
- 4 Select the gateway mode from the **Mode** drop down menu.
- 5 If you selected the **Forwarding** mode in the step above, select the destination gateway in the **Forward To** drop-down list. You can also select a specific IP address in the **On IP** drop-down list if the Gateway server has more than one.
- 6 Select the **Add an SSL certificate and enable HTML5 Gateway** option to automatically create a self-signed certificate, enable SSL, and enable HTML5 support. For more info, please see **Enable HTML5 Support on the Gateway** (p. 131).
- 7 Select the **Add Firewall Rules** to automatically configure the firewall on the server hosting the gateway. See **Port Reference** (p. 252) for details.
- 8 Click **Next**.
- 9 On the next page, click **Install** to start the RAS Secure Client Gateway installation.
- 10 Click **Done** when the installation is finished.

Manually Adding a RAS Secure Client Gateway

To manually install a RAS Secure Client Gateway and add it to the farm, follow these steps:

- 1 Log into the server where you'll be installing the RAS Secure Client Gateway using an administrator account.
- 2 Copy the Parallels Remote Application Server installation file (**RASInstaller.msi**) to the server and double click it to launch the installation wizard.
- 3 Once prompted, click **Next** and accept the End-User license agreement.
- 4 Select the path where the RAS Secure Client Gateway should be installed and click **Next**.
- 5 Select **Custom** from the installation type screen and click **Next**.
- 6 Click on **RAS SecureClientGateway** in the feature tree and select **Entire Feature will be installed on local hard drive**.
- 7 Ensure that all other components in the selection tree are cleared and click **Next**.
- 8 Click **Install** to start the installation.
- 9 When the installation is completed, click **Finish** to close the wizard.
- 10 Open the RAS Console and specify the RAS Publishing Agent that will manage the gateway.

Checking the RAS Secure Client Gateway Status

To check the status of a RAS Secure Client Gateway, right-click it in the list and then click **Check Status** in the context menu. The **RAS Secure Client Gateway Information** dialog opens.

The dialog displays the gateway information, including:

- **Server:** The name of the server on which the gateway is installed.
- **Gateway:** The gateway verification status (e.g. Verified).
- **Version:** The gateway software version number. The version number must match the Parallels RAS version number.
- **OS Type:** Operating system type and version.
- **Status:** Display the current RAS Secure Client Gateway status. If the status indicates a problem (e.g. the gateway did not reply or the gateway software version is wrong), click the **Install** button to push install the gateway software on the server. Wait for the installation to complete and check the status again.

Configuring RAS Secure Client Gateway

To configure a RAS Secure Client Gateway:

- 1 In the RAS console, navigate to **Farm / Site / Gateways**.
- 2 In the right pane, right-click a gateway and click **Properties**.
- 3 The **RAS Secure Client Gateway Properties** dialog opens.

Read on to learn how to configure the RAS Secure Client Gateway properties.

Enable or Disable a Gateway

A RAS Secure Client Gateway is enabled by default. To enable or disable a gateway, use the **Enable RAS Secure Client Gateway in site** option on the **Properties** tab page of the **RAS Secure Client Gateway Properties** dialog.

Set the Gateway Mode and Forwarding Settings

To change the gateway mode (normal or forwarding) and configure related settings click the **Properties** tab in the **RAS Secure Client Gateway Properties** dialog.

Setting the normal mode

To set the normal mode, in the **Gateway Mode** drop-down list, select **Normal**.

The **Forward requests to HTTP Server** option allows you to forwards requests that do not belong to RAS Secure Client Gateways (Gateways handle HTML5 traffic, Wyse, and URL Schema). To specify multiple servers, separate them with a semicolon. An HTTP server can be specified using an IPv6 address. Please note that an HTTP server must support the same IP version as the browser making the request.

The **Preferred Publishing Agent** drop-down list allows you to specify a RAS Publishing Agent that the gateway should connect to. This is helpful when site components are installed in multiple physical locations communicating through WAN. You can decrease network traffic by specifying a more appropriate Publishing Agent. For the gateway to select a Publishing Agent automatically, select the **Automatically** option.

Setting the forwarding mode

To configure the forwarding mode, in the **Gateway Mode** drop-down list, select **Forwarding**.

Specify (or select) one or more forwarding gateways in the **Forwarding RAS Secure Client Gateway(s)** field.

Note: The forwarding mode allows you to forward the data to a gateway listening on IPv6. It is recommended that forwarding gateways are configured to use the same IP version.

Set IP Address for Incoming Connections

The **IP Address** tab page is used to set IP address options for incoming client connections.

RAS Secure Client Gateway recognizes both IPv4 and IPv6. By default, IPv4 is enabled. If a gateway has IPv6 and IPv4 configured, you can specify whether clients should be connecting using IPv4, IPv6, or both. To do so, in the **Use IP version** drop-down list:

- 1 Select the IP version to use and then specify the corresponding properties for the selected version (or both if you selected IPv4 and IPv6).
- 2 Click the **Resolve** button to resolve the IP addresses of the RAS Secure Client Gateway depending on the IP version selected.

The **Bind to the following IPv4/IPv6** fields are used to specify one or more IP addresses on which the RAS Secure Client Gateway should listen for incoming connections. To specify multiple IP addresses, separate them with a semicolon.

The **Optimize connection for the following IPv4/ IPv6** fields can be used when the connection between the gateway and the Parallels Client has a high latency (such as the Internet). This option will optimize traffic for better experience on the Parallels Client side. You can select a specific address, all available addresses, or none to disable this option.

Configure RAS Secure Client Gateway Network Options

The Network tab page is used to configure RAS Secure Client Gateway network options.

By default a RAS Secure Client gateway listens on TCP ports 80 and 443 to tunnel all Parallels Remote Application Server traffic. To change the port, specify a new port in the RAS Secure Client Gateway Port input field.

RDP port 3389 is used for clients that require basic load balanced desktop sessions. Connections on this port do not support published resources. To change the RDP port on a gateway select the RDP Port option and specify a new port.

Note: If RDP port is changed, the users need to append the port number to their connection string in the remote desktop client (e.g. [ip address]:[port]).

Broadcast RAS Secure Client Gateway Address. This option can be used to switch on the broadcasting of the gateway address, so Parallels Clients can automatically find their primary gateway. The option is enabled by default.

Enable RDP UDP Data Tunneling. To enable UDP tunneling on Windows devices, select this option (default). To disable UDP tunneling, clear the option.

Client Manager Port. Select this option to enable management of Windows devices from the **Client Manager** category. The option is enabled by default.

Enable RDP DOS Attack Filter. When selected, this option denies chains of uncompleted sessions from the same IP address. For example, if a Parallels Client initiates multiple successive sessions with each session waiting for the user to provide credentials, Parallels RAS will deny further attempts. The option is enabled by default.

Configure SSL Encryption on a Gateway

The traffic between the users and the RAS Secure Client Gateway can be encrypted. The **SSL/TLS** tab page allows you to configure data encryption options.

By default, a self-signed certificate is installed during the RAS Secure Client Gateway installation and TLS v1.0, v1.1, or v1.2 is used. Each RAS Secure Client Gateway has its own certificate, which should be added to Trusted Root Authorities on the client side to avoid security warnings.

To issue a new self-signed certificate:

- 1 Select the **Enable SSL on Port** option and specify a port number (default is 443).
 - 2 (Optional) Select the SSL version accepted by the RAS Secure Client Gateway from the **Accepted SSL Versions** drop-down list (default is TLS v1 - TLS v1.2).
 - 3 (Optional) Select the **Cipher Strength** as the certificate encryption algorithm strength of your choice. The default cipher strength is High. A stronger cipher allows for stronger encryption, which increases the effort needed to break it.
 - 4 Click the **Generate new certificate** button and enter the required details.
- Note:** To enable SSL using a certificate from a trusted authority, follow the procedure below.
- 5 Click **Save** to save all the details and generate a new self-signed certificate. The **Private Key file** and **Certificate file** fields will be populated automatically.
 - 6 Click **OK** to save the options and close the dialog.

Using a Custom Cipher

You can use the **Cipher** field to specify a custom cipher string of your choice in accordance with the openssl standards. Cipher strings used by Parallels Remote Application Server are described below:

Low: ALL:!aNULL:!eNULL

Med: ALL:!aNULL:!ADH:!eNULL:!LOW:!EXP:RC4+RSA:+HIGH:+MEDIUM

High:

128

- Min SSLv2 - ALL:!aNULL:!ADH:!eNULL:!LOW:!MEDIUM:!EXP:+HIGH
- Min SSLv3 - ALL:!SSLv2:!aNULL:!ADH:!eNULL:!LOW:!MEDIUM:!EXP:+HIGH
- Min TLSv1 - ALL:!SSLv2:!SSLv3:!aNULL:!ADH:!eNULL:!LOW:!MEDIUM:!EXP:+HIGH
- Min TLSv1_1 - ALL:!SSLv2:!SSLv3:!TLSv1:!aNULL:!ADH:!eNULL:!LOW:!MEDIUM:!EXP:+HIGH
- Min TLSv1_2 -
ALL:!SSLv2:!SSLv3:!TLSv1:!TLSv1.1:!aNULL:!ADH:!eNULL:!LOW:!MEDIUM:!EXP:+HIGH

Note: By default only the connection between the gateway and the servers is encrypted. Change the connection mode to the Gateway SSL Mode from the connection properties on all Parallels Clients to also encrypt the connection between the users and the gateway.

To simplify the Parallels Client configuration, using a certificate issued either by a third party Trusted Certificate Authority or Enterprise Certificate Authority (CA) is recommended.

If an Enterprise CA certificate is used, Windows clients receive a Root or Intermediate Enterprise CA certificate from Active Directory. Client devices on other platforms require manual configuration.

If a third-party certificate issued by a well-known Trusted Certificate Authority (e.g. Verisign) is used, the client device trusts using Trusted Certificate Authority updates for the platform.

Using Third-Party Trusted Certificate Authority

- 1 In the RAS Console, navigate to **Farm > Gateway > Properties** and click the **SSL/TLS** tab.
- 2 Select TLS 1.2 as the SSL settings option.
- 3 Choose CSR.
- 4 Fill in the data.
- 5 Copy and paste the CSR into a text editor and save the file for your records.
- 6 Paste the CSR into the party Vendors Website page or email it to the vendor.
- 7 Request a return certificate in the following format: Apache, with the private, public and intermediate CA all in one file, with extension **.pem**.
- 8 When you receive the file, place it in a secure folder for backup retrieval.
- 9 Click **Import Public Key** and navigate to the folder (or navigate to a secondary location where you have a copy of the single all-in-one cert) and insert the **.pem** file into the **Certificate key** field.
- 10 Click **Apply** and **Test**.

Note: The private key should already be populated from your initial CRS request.

Using Enterprise Certificate Authority

Use IIS to receive a certificate from Enterprise CA and export the certificate in the PFX format.

Install the PFX certificate on RAS Secure Client Gateway as follows:

- 1 Launch the Parallels RAS Console.
- 2 Select a RAS Secure Client Gateway, open its properties and switch to the SSL tab page.
- 3 Click [...] next to **Private Key** or **Public Key** fields.
- 4 Browse for the .pfx file and click **OK**.
- 5 Click **Apply**.

Note: The `trusted.pem` file on the Parallels Client side must include the intermediate certificate to be able to verify the cert from the third-party vendor. If the intermediate certificate for the vendor is not in the `trusted.pem` file, you will have to paste it in manually or create a `trusted.pem` template file with the proper Intermediate Certificates and then replace the old `trusted.pem` file with the newly updated one. This file resides in the `Program Files\Parallels` or `Program Files(x86)\ Parallels` on the client side.

Enable SSL on Parallels Secure Client Gateway with cert.pem

- 1 On the Parallels Client Gateway page, enable secure sockets layer (SSL) and click [...] to browse for the pem file.
- 2 Place the single file generated in the **Private Key** and **Public Key** fields.
- 3 Click **Apply** to apply the new settings.
- 4 Your browser may not support displaying this image.

Parallels Clients Configuration

In case the certificate is self-signed, or the certificate issued by Enterprise CA, Parallels Clients should be configured as described below.

- 1 Export the certificate in Base-64 encoded X.509 (.CER) format.
- 2 Open the exported certificate with a text editor, such as notepad or WordPad, and copy the contents to the clipboard.

To add the certificate with the list of trusted authorities on the client side and enable Parallels Client to connect over SSL with a certificate issued from an organization's Certificate Authority.

- 1 On the client side in the directory "C:\Program Files\Parallels\Remote Application Server Client\" there should be a file called `trusted.pem`. This file contains certificates of common trusted authorities.
- 2 Paste the content of the exported certificate (attached to the list of the other certificates).

Securing RDP-UDP Connections

A Parallels Client normally communicates with a RAS Secure Client Gateway over a TCP connection. Recent Windows clients may also utilize a UDP connection to improve WAN performance. To provide the SSL protection for UDP connections, DTLS must be used.

To use DTLS on a RAS Secure Client Gateway:

- 1 On the **SSL/TLS** tab page, make sure that the **Enable SSL on Port** option is selected (default).
- 2 On the **Network** tab page (p. 127), make sure that the **Enable RDP UDP Data Tunneling** option is selected (default).

The Parallels Clients must be configured to use the **Gateway SSL Mode**. This option can be set in the **Connections Settings > Connection Mode** drop-down list on the client side.

Once the above options are correctly set, both TCP and UDP connections will be tunneled over SSL.

Configure HTML5 Connectivity

The **HTML5** tab page is used to configure HTML5 connectivity.

HTML5 connectivity is a functionality built into the RAS Secure Client Gateway. When the connectivity is enabled (default), end users can run published resources using Parallels HTML5 Client that runs inside a web browser.

Parallels HTML5 Client works similarly to a platform-specific Parallels Client application with the exception that end users don't have to install any additional software on their computers or devices — all they need is an HTML5-enabled web browser. This section describes how to configure HTML5 connectivity in the Parallels RAS Console. For the information about how to use it, please refer to **Using Parallels HTML5 Client** (p. 136).

Note: To use HTML5 connectivity, SSL must be enabled on the Gateway. When enabling HTML5, please verify that SSL is enabled on the **SSL/TLS** tab page or on your network load balancer. Please also note that the **HTML5** tab is only available if the gateway mode is set to "normal". For more information, see **Set the Gateway Mode and Forwarding Settings** (p. 126).

To configure HTML5 connectivity, set the options described below.

Gateway

Enable HTML5 Connectivity: Select or clear this option to enable or disable HTML5 on the gateway.

Port: Specify a custom port number if necessary.

URL: Specifies the complete URL that end users will need to enter in their web browsers to connect to Parallels RAS. The URL consists of the RAS Secure Client Gateway server FQDN (or computer name) or IP address followed by "RASHTML5Gateway".

Note: You can simplify or even override this URL on the **Web Requests** tab page of the **RAS Secure Client Gateway Properties** dialog. For example, you can make it possible for your users to enter just the server FQDN or IP address (without the "RASHTML5Gateway" part) to access the HTML5 login page. If you use HTML5 Client Themes (a Parallels RAS feature), you can specify a URL that will open a particular theme's login page. For more information, please see **Specifying a URL for Web Requests** (p. 133) and **Configure HTML5 Client Themes** (p. 136).

Client

Launch sessions using: Allows you to specify whether remote applications and desktops will be launched on user computers in a web browser (HTML5 Client) or in a platform-specific Parallels Client. Parallels Client includes a richer set of features compared to HTML5 Client, thus providing end users with a better user experience. Select one of the following:

- **Launch apps in browser only (HTML5 only)** — Users can run remote applications and desktops using Parallels HTML5 Client only. Use this option if you don't want your users to install a platform-specific Parallels Client.
- **Launch apps with Parallels Client** — Users can run remote applications and desktops in Parallels Client only. When a user connects to Parallels RAS using Parallels HTML5 Client, they will be asked to install the platform-specific Parallels Client before they can launch remote applications and desktops. A message will be displayed to the user with a link for downloading the Parallels Client installer. After the user installs Parallels Client, they can still select a remote application or desktop in Parallels HTML5 Client but it will open in Parallels Client instead.
- **Launch apps with Parallels Client and fallback to HTML5** — Both Parallels Client and a browser (HTML5) can be used to launch remote applications and desktops. Parallels Client will be the primary method; Parallels HTML5 Client will be used as a backup method if a published resource cannot be launched in Parallels Client for any reason. A user will be informed if a resource couldn't be opened in Parallels Client and will be given a choice to open it in the browser instead.

Allow users to select a launch method: If selected, users will be able to choose whether to open remote applications in a browser or in Parallels Client. You can enable this option only if the **Launch session using** option (above) is set to **Launch apps in Parallels Client and fallback to HTML5** (i.e. both methods are allowed).

Use Pre Windows 2000 login format: If this option is selected, it allows you to use legacy (pre-Windows 2000) login format.

Restrictions

Allow embedding of Web Client into other web pages: If selected, the Parallels HTML5 Client web page can be embedded in other web pages. Please note that this may be a potential security risk due to the practice known as clickjacking.

Allow file transfer command: Enables or disables the remote file transfer functionality. For more information, see **Enabling or Disabling Remote File Transfer** (p. 206).

Allow clipboard command: Enables or disables the Remote Clipboard. For more information, see **Using the Remote Clipboard** (p. 147).

Enable Support for Wyse Thin Client OS

To publish applications from the Parallels Remote Application Server to thin clients using the Wyse thin client OS, select the **Enable Wyse ThinOS Support** option on the **Wyse** tab page.

Note: The Wyse tab is only available if the gateway mode is set to normal. See **Set the Gateway Mode and Forwarding Settings** for more info (p. 126).

By enabling this option, the RAS Secure Client Gateway will act as a Wyse broker. You need to make sure that DHCP option 188 on your DHCP server is set to the IP address of this gateway for thin clients that will be booting via this gateway. Once the DHCP server is configured, click the **Test** button to verify the DHCP server settings.

Filter Access to a RAS Secure Client Gateway

You can allow or deny user access to a gateway based on a MAC address. This can be accomplished using the **Security** tab page in the **RAS Secure Client Gateway Properties** dialog.

To configure a list of allowed or denied MAC addresses, click the **Security** tab and select one of the following options:

- **Allow all except.** All devices on the network will be allowed to connect to the gateway except those included in this list. Click **Tasks > Add** to select a device or to specify a MAC address.
- **Allow only.** Only the devices with the MAC addresses included in the list are allowed to connect to the gateway. Click **Tasks > Add** to select a device or to specify a MAC address.

Specifying a URL for Web Requests

The **Web Requests** tab page allows you to specify a URL which will open when a user enters the IP address of the RAS Secure Client Gateway server in a web browser.

Note: The **Web Requests** tab is only available if the gateway mode is set to normal. See **Set the Gateway Mode and Forwarding Settings** for more info (p. 126).

Generally speaking, you can enter any URL on the **Web Requests** tab page. As a result, when end users enter the gateway's IP address or FQDN in a web browser, they will be redirected to the URL specified on this tab page. Real-world scenarios of using the URL redirection are as follows:

- End users enter the gateway's FQDN or IP address in a web browser and get redirected to the HTML5 Client login page. For this to happen, the **Web Requests** tab page must specify the actual HTML5 URL, which is the default value. You can see the actual URL on the **HTML5** tab page or you can simply click the **Default** button which will populate the field with it.
- When using HTML5 Client themes, you can specify a URL of a particular theme, such as `https://server.company.com/RASHTML5Gateway/?theme=MyTheme`. This way, when a user enters the server IP address or FQDN, they will be redirected to the specified theme page. For more info about themes, please see **Configuring HTML5 Client Themes** (p. 136).
- If you disabled the HTML5 connectivity on the gateway, you can specify a URL of a completely different page on another web server to which users will be redirected instead of trying to open the HTML5 Client login page.

Gateway Tunneling Policies

Tunneling policies can be used to load balance connections by assigning a group of RD Session Hosts to a specific RAS Secure Client Gateway or RAS Secure Client Gateway IP address.

To configure tunneling policies, navigate to **Farm / Site / Gateways** and then click the **Tunneling Policies** tab in the right pane.

The **<Default>** policy is a preconfigured rule and is always the last one to catch all non-configured gateway IP addresses and load balance the sessions between all servers in the farm. You can configure the **<Default>** policy by right-clicking it and then clicking **Properties** in the context menu.

Adding a New Tunneling Policy

To add a new policy:

- 1 Click **Tasks > Add**.
- 2 Select a gateway IP address.
- 3 Specify to which RD Session Host(s) the users connecting to that specific gateway should be forwarded to.

Managing a Tunneling Policy

To modify an existing Tunneling Policy, right-click it and then click **Properties** in the context menu.

Viewing Gateway Overview

In addition to the Gateways editor described in this chapter, you can also see the summary about the available RAS Secure Client Gateways. To do so:

- 1** In the RAS Console, select the **Farm** category and then select the **Site** node in the middle pane.
- 2** The available RAS Secure Client Gateway servers are displayed in the **Gateways** group in the right pane.
- 3** To go to the Gateways editor, right-click a server and choose **Show in the Editor**.

For additional info, see **Viewing Sites in the RAS Console** (p. 33).

Parallels HTML5 Client

Parallels HTML5 Client is a RAS client application that runs in a web browser. Users can use Parallels HTML5 Client to view, launch, and work with remote applications and desktop in a web browser.

Compared to platform-specific Parallels Clients (e.g. Parallels Client for Windows, Parallels Client for iOS, etc.), Parallels HTML5 Client does not require end users to install additional software on their computers or mobile devices. Feature-wise, platform-specific Parallels Clients give users more control over their Parallels RAS experience than Parallels HTML5 Client. Nonetheless, Parallels HTML5 Client is a fully-featured platform-independent client providing end users with an alternate method of working with remote resources published via Parallels RAS.

Please note that the RAS HTML5 Gateway (the server side) requires Windows Server 2008 R2 or higher (it will not work on Windows Server 2008).

The only requirement for the client side is an HTML5-enabled web browser.

In This Chapter

Configure HTML5 Connectivity	136
Configure HTML5 Client Themes.....	136
Open Parallels HTML5 Client.....	138
Main Menu Options	140
Launching Remote Applications and Desktops.....	141
Using the Toolbar	142
HTML5 Gateway API.....	149

Configure HTML5 Connectivity

HTML5 connectivity is a part of RAS Secure Client Gateway. To be used by end users, the HTML5 connectivity must be enabled and configured in the RAS Console as described in **Enabling HTML5 Connectivity on the Gateway** (p. 131).

Configure HTML5 Client Themes

A theme is a combination of colors, title, icons, display language, and some other items that users will experience when they open the Parallels HTML5 Client in their web browsers.

To manage themes, navigate to **Farm / Site / Themes** in the Parallels RAS Console. The **Themes** view in the right pane displays the available themes. The list contains at least one default theme. This theme cannot be removed but you can customize it as needed. In addition to the default theme, you can create your own themes.

To create a new or modify an existing theme:

- Click **Tasks > New Theme** (or click the **[+]** icon) to create a new theme.
- Double-click an existing theme (or right-click it and choose **Properties**).

The **Theme Properties** dialog opens. Use the dialog to create a new or modify an existing theme. The instructions below apply to both scenarios.

General

On the **General** tab page of the **Theme Properties** dialog, specify the following theme properties:

- **Enable Theme:** Enable or disable the theme. Note that you cannot disable the default theme.
- **Name:** Specify a theme name. This field is mandatory.
- **Description:** Specify an optional theme description.
- **Theme login page:** This field is populated automatically with the theme name, but you can replace it with a name of your choice. The complete name (including the read-only `https://FQDN/RASHTML5Gateway/?theme=` part) forms a URL of the theme login page. Users will enter this URL in their web browsers and see the customized Parallels HTML5 Client login page.

For example, if you enter **MyTheme** in this field, the complete URL becomes `https://FQDN/RASHTML5Gateway/?theme=MyTheme`. When you give the URL to end users, replace the "FQDN" part with the actual FQDN or IP address of the RAS Secure Client Gateway server where you have HTML5 connectivity enabled.

Note that the `https://FQDN/RASHTML5Gateway` part is the same as the URL found on the HTML5 tab page of the **RAS Secure Client Gateway Properties** dialog (p. 131).

- **Limit access to this theme to members of these Active Directory groups:** If this option is cleared, any Parallels RAS user can access the theme if they know its URL. To limit access to a particular group (or groups), select this option and then click **Tasks > Add** (or click the **[+]** icon) and select the desired group(s).

Appearance

On the **Appearance** tab page, specify the following options:

- **Colors.** Select this option in the left pane and then specify the desired colors for the HTML5 login page header and footer.

- **Company.** Select this option and then enter your company name. Click **Browse** and select the company logo file (a picture 158x35 pixels in PNG format). Click the other **Browse** button and select the favicon file (the icon must be 32x32 pixels in PNG format; it will appear in front of the HTML5 client page name in a web browser).
- **Messages.** Specify the pre-logout and post login messages. The max length of a message is 500 characters. The pre-logout message appears on the Log in page. The post-logout message appears as a message box immediately after the user successfully logs in.
- **Language Bar.** Select the languages that will appear in the language selector on the Parallels HTML5 Client page. The selector appears as a language flag icon on the page header to the right of the user name.
- **Footer URLs.** This option allows you to specify custom URLs that will be placed in the Parallels HTML5 Client footer. To add a URL, click **Tasks > Add** and specify a URL, a text that will appear on the page footer, and a tooltip text. When entering similar URLs, you can duplicate an existing one by right-clicking it and choosing **Duplicate** (or select an entry and click the "duplicate" icon next to the [-] icon). If you've added multiple URLs, you can reorder them by clicking the up or down arrow icons or selecting **Up** or **Down** items in the **Tasks** menu. The URLs will appear in the footer in the order listed (you can click the **Preview** button to see how it looks).
- **Preview.** Click the button to see how the theme will look in a web browser.

When done customizing the theme, click the **Preview** button to see a preview of the Parallels HTML5 Client app launcher. If satisfied, click the **OK** button to save the theme and close the dialog.

You can also perform the following actions on the **Themes** tab page in the Parallels RAS Console:

- Duplicate a theme — right-click a theme and choose **Duplicate** (or select a theme and click **Tasks > Duplicate**).
- Preview a theme — right-click a theme and choose **Preview** (or **Tasks > Preview**).
- Delete a theme — right-click a theme and choose **Delete** (or **Tasks > Delete**).

When done creating or modifying themes, click **Apply** in the Parallels RAS Console to commit the changes to Parallels RAS. You can now test a theme by opening its URL in an HTML5-enabled web browser.

Open Parallels HTML5 Client

To open Parallels HTML5 Client, enter its URL in an HTML5-enabled web browser. The URL that you should give to your Parallels RAS users depends on how it is configured in the Parallels RAS Console and whether you have HTML5 Client themes (p. 136) defined in the Parallels RAS Console.

To obtain the HTML5 Client URL:

- 1 In the Parallels RAS Console, navigate to **Farm / Site / Gateways**.
- 2 Right-click a RAS Secure Client Gateway click **Properties**.

3 In the **Properties** dialog, do one of the following:

- Select the **HTML5** tab page and copy the URL from the **URL** field. This is the actual HTML5 Client URL that opens the default HTML5 Client theme.
- To open a particular HTML5 Client theme, use the URL from the HTML5 tab page followed by `"/?theme=theme-name"`. For example:
`https://myserver/RASHTML5Gateway/?theme=MyTheme`
- Select the **Web Request** tab page. If the URL specified there is the same as the one on the **HTML5** tab page, your users can enter just the FQDN or IP address of the Gateway to open Parallels HTML5 Client.
- If you (or another Parallels RAS administrator) have specified a URL on the **Web Request** tab page that opens a specific HTML5 Client theme, entering the FQDN or IP address of the Gateway will open that theme.

When you open the URL in a web browser, the login page is displayed. Specify the user name and password and click **Login**. What happens next depends on how the HTML5 connectivity is configured on the server side (see **Enabling HTML5 Connectivity on the Gateway** (p. 131) for details). The following describes the three possible scenarios.

Launch apps in Parallels Client and fallback to HTML5

With this option configured on the server side, you will see a dialog box in the web browser with the following options:

- **Install Parallels Client.** Opens the Parallels Client download and installation page. Follow the instructions and install Parallels Client. After the installation, you should see the Parallels HTML5 Client displaying published resources that you can use. Please also note a link in the lower left corner of the screen displaying the Parallels Client version and build number.

You can now run remote applications and desktop in Parallels Client or in a browser (HTML5). The default method for running applications and desktops is Parallels Client. To run a remote application or desktop in a browser, right-click it (or tap and hold on a mobile device) and then choose Parallels HTML5 Client.

- **Open in Parallels HTML5 Client.** Closes this dialog box and opens the main Parallels HTML5 Client screen. Remote applications or desktops will be launched in the web browser. When you open Parallels HTML5 Client the next time, you will again see the same dialog box with the same options.
- **Always open in Parallels HTML5 Client.** This option works similarly to the option above but your selection is remembered the next time you open Parallels HTML5 Client.

Launch apps in Parallels Client

When this option is configured on the server side, you will see a dialog box prompting you to install Parallels Client. Click the link provided to open the Parallels Client download and installation page and follow the instructions. After you install Parallels Client, the main Parallels HTML5 Client screen opens displaying published resources that you can use. If you now double-click or tap a resource, it will be launched in Parallels Client.

Launch apps in browser only (HTML5 only)

With this option configured, the main Parallels HTML5 Client screen opens with no additional prompts. Remote applications and desktops will be launched in the web browser.

Main Menu Options

To open the Parallels HTML5 Client main menu, click or tap the arrow next to your user name in the upper-right. You can select from the following menu options:

Settings: Allows you to configure the following settings:

- **Sound.** To play the sound on the local computer, select the **Bring to this computer** option. If sound is not supported by your browser, the menu will be disabled and you'll see a corresponding text message below it.
- **Remote audio recording.** Enables or disable the sound input redirection from the local computer to the remote application. For example, if you would like to use a microphone in Skype or a similar app for teleconferencing, you need to enable audio recording in Parallels HTML5 client. Select **Record from this computer** to enable recording or select **Do not record** to disable it.

Note: Audio input is supported in Chrome, Firefox, Edge and Safari 11. If your browser doesn't support audio input, this setting will be disabled and you will see a text message instead.

- **Redirect Links.** Select a desired redirection option from the following: **Do no redirect**, **Redirect URLs**, **Redirect email**, **Redirect all**. When a redirection is enabled, a link will be opened on the local computer.
- **Redirect Printers.** Select a printer redirection option: **RAS Universal Printer** (uses the RAS Universal Printing technology) or **Do not redirect** (printers will not be redirected).
- **Keyboard Mode.** Select **Universal Keyboard** or **PC Keyboard**. If you have problems typing certain characters, try selecting **PC Keyboard** and then selecting a proper layout in the **Keyboard Layout** drop-down list (see below).
- **Keyboard Layout.** Select a keyboard layout (e.g. English (US), English (UK), Japanese). To enable this drop-down list, the Keyboard Mode option must be set to PC Keyboard.

Change Password: Allows you to remotely change your domain password.

Download Client: Click this option to open a web page with instruction on how to download and install Parallels Client. You can also download Parallels Client by clicking the **Parallels Client not installed** link in the lower left corner of the web page.

Logout: Ends your session with Parallels RAS and logs you out.

Launching Remote Applications and Desktops

To launch remote applications and desktop in Parallels HTML5 Client:

- Double-click (or tap on a mobile device) an application or a desktop icon. The resource will open inside a web browser or in Parallels Client depending on the server-side HTML5 configuration (**RAS Secure Client Gateway Properties > HTML5 > Launch sessions using** option).
- Right-click (or tap and hold on a mobile device) an application or a desktop to display a context menu. Note that the menu will only appear if the **Allow user to select launch method** option is selected on the **RAS Secure Client Gateway Properties > HTML5** tab page in the RAS console. The menu allows you to choose whether to open the resource in Parallels Client or Parallels HTML5 Client. If both methods are allowed and if Parallels Client is installed on the device, both options will be available.
- If a resource cannot be opened in Parallels Client due to an error, a message will be displayed with an option to open it in the web browser instead.

Please note that to open a resource in Parallels Client from the HTML5 page, a URL with a custom scheme is used. When you double-click on a resource on the HTML5 page, the URL is executed and is then passed to Parallels Client which uses the instructions that it contains to open the resource. For technical information about the URL, please see **Parallels Client URL Scheme** (p. 257).

Other useful functionality on the main Parallels HTML5 Client screen includes the following:

- **Favorites list.** You can add a remote application or a desktop to the Favorites list, so you can easily find them. To do so, point to or tap an application or a desktop and then click or tap the star icon. To view the list, click or tap the star icon on the toolbar in the upper-right (next to the Search box). To remove a resource from the list, point to it in the list and click the "X" icon (or point to or tap the resource icon and then click or tap the start icon).
- **Search.** To search for a resource, begin typing its name in the Search box on the toolbar. The list will be filtered as you type to contain only the resources with matching names.
- **View a description.** To view a resource description, position the mouse pointer over it. The description will appear as a tooltip. This could be helpful if one or more resources are published using the same name. By reading the description, you can distinguish between them.
- **Taskbar.** When you launch a remote application or a desktop, its icon is added to the taskbar at the bottom of the screen. When the taskbar is full, items of the same type are grouped to save space. You can click or tap on a group to see the list of all running instances and to switch to or close a particular instance.

Using the Toolbar

When you launch a remote application or desktop in a web browser (HTML5), a toolbar appears on the right side of the web browser window. The toolbar appears differently for remote desktops and remote applications. The toolbar has also slightly different functions for desktop computers and mobile devices. The differences are explained in the subsequent topics.

This section contains the following topics:

- **Using the Toolbar on Desktop Computers** (p. 142)
- **Using the Toolbar on Mobile Devices** (p. 145)

Using the Toolbar on Desktop Computers

Remote Desktop Toolbar

When you launch a remote desktop in a web browser on a desktop or laptop computer, the toolbar appears as follows:

The top area of the toolbar is used to drag the toolbar up or down. Click and hold it and then drag the toolbar to the desired position. The arrow icon is used to show or hide the toolbar items.

The main toolbar items are (from top to bottom):

- **Full screen.** Display the remote desktop in full screen on the local computer.

- **Upload a file.** Upload a file from the local computer to the remote server. After clicking this item, you are presented with two dialogs, one after another. In the first dialog, select a file on the local computer you wish to upload. In the second dialog, select a location on the remote server where you want to save the file.
- **Download a file.** Download a file from the remote server to the local computer. After clicking this item, select a file on the remote server you wish to download. Depending on your web browser configuration, the download will start automatically or you will be asked to select a destination folder on your local computer.
- **Shortcuts.** Display the **Shortcuts** menu (see below for the menu description).
- **Clipboard.** Display the remote clipboard. Please see **Using the Remote Clipboard** (p. 147) for more information.

The **Shortcuts** menu allows you to send keystrokes and key sequences to the remote desktop:

- **Escape.** Sends the "Escape" keystroke to the remote desktop.
- **Tab.** Sends the "Tab" keystroke.
- **Backspace.** Sends the "Backspace" keystroke.
- **Control+Alt+Delete.** Sends the Ctrl+Alt+Delete key sequence.
- **Print screen.** Sends the "Print Screen" keystroke. The screen will be printed to the clipboard of the remote desktop from where you can paste it into an application (e.g. Paint) running on the same remote computer.

Remote Application Toolbar

When you launch a remote application, the toolbar appears as follows:

The top area of the toolbar is used to drag the toolbar up or down.

The main toolbar items are (from top to bottom):

- **Clipboard.** Display the remote clipboard. Please see **Using the Remote Clipboard** (p. 147) for more information.
- **Upload a file.** Upload a file from the local computer to the remote server. After clicking this item, you are presented with two dialogs, one after another. In the first dialog, select a file on the local computer you wish to upload. In the second dialog, select a location on the remote server where you want to save the file.
- **Download a file.** Download a file from the remote server to the local computer. After clicking this item, select a file on the remote server you wish to download. Depending on your web browser configuration, the download will start automatically or you will be asked to select a destination folder on your local computer.

Using the Toolbar on Mobile Devices

Remote Desktop Toolbar

When you launch a remote desktop in a web browser on a mobile device, the toolbar appears as follows:

The small arrow icon at the top is used to show or hide the toolbar items.

The main toolbar items are (from top to bottom):

- **Upload a file.** Upload a file from the local device to the remote server. Note that in iOS, you can upload from the Photos folder only.
- **Download a file.** Download a file from the remote server to the local device (not available in iOS).
- **Shortcuts.** Display the **Shortcuts** menu (see below for the menu description).
- **Clipboard.** Display the remote clipboard. Please see **Using the Remote Clipboard** (p. 147) for more information.
- **Keyboard.** Display the native keyboard. This opens your mobile device native keyboard so you can type in an application on the remote desktop.
- **Arrow.** The arrow icon is used to switch between the two available mouse input modes:
 - Mode 1:** The first mode (the arrow icon is white) follows the movement of your finger on the screen and performs a click on a remote desktop where you tap.
 - Mode 2:** The second mode (the arrow icon is red) displays a virtual mouse pointer on the remote desktop and allows you to move that pointer to a precise position with your finger. When you tap anywhere on the screen, the click on the remote desktop is performed at the precise position of the virtual mouse pointer.

The **Shortcuts** menu allows you to send keystrokes and key sequences to the remote desktop:

- **Escape.** Sends the "Escape" keystroke to the remote desktop.
- **Tab.** Sends the "Tab" keystroke.
- **Backspace.** Sends the "Backspace" keystroke.
- **Control+Alt+Delete.** Sends the Ctrl+Alt+Delete key sequence.
- **Print screen.** Sends the "Print Screen" keystroke. The screen will be printed to the clipboard of the remote desktop from where you can paste it into an application (e.g. Paint) running on the remote computer.

Remote Application Toolbar

When you launch a remote application in a web browser on a mobile device, the toolbar appears as follows:

The main toolbar items are (from top to bottom):

- **Clipboard.** Display the remote clipboard. Please see **Using the Remote Clipboard** (p. 147) for more information.

- **Upload a file.** Upload a file from the local device to the remote server. Note that in iOS, you can upload from the Photos folder only.
- **Download a file.** Download a file from the remote server to the local device (not available in iOS).
- **Keyboard.** Display the native keyboard. This opens your mobile device native keyboard so you can type in an application on the remote desktop.

Using the Remote Clipboard

The Remote Clipboard feature allows you to copy and paste text between a remote application and the local device. The clipboard is accessed from the toolbar which appears on the right side of the web browser window when you launch a remote desktop or application.

To use the clipboard:

- 1 Expand the toolbar on the right side of the browser window and click the **[A]** icon.

- 2 This opens the **Remote Clipboard** window.

- 3 To copy text from the local computer to a remote application, type (or paste) it in the **Remote Clipboard** window. The text is automatically saved on the remote computer clipboard, so you can use a standard paste command (e.g. Ctrl+V) to paste it into a remote application.
- 4 To copy text from a remote application to the **Remote Clipboard** window, highlight it and use the standard copy command (e.g, Ctrl+C). The text will appear in the **Remote Clipboard** window from where you can copy it to a local application.

The "For more details, click here" link opens a KB article containing information about using the Remote Clipboard.

Hiding Toolbar Items

You can hide the clipboard and file transfer items on the toolbar if you believe that it's a security risk.

The clipboard can be disabled on a RAS Secure Client Gateway or Client Policy level.

To disable the clipboard for a Gateway:

- 1 In the Parallels RAS Console, navigate to **Farms / Site / Gateways**.
- 2 Right-click a desired RAS Secure Client Gateway and choose **Properties**.
- 3 Select the **HTML5** tab and clear the **Allow clipboard command** option in the **Restrictions** section.

You can also disable the clipboard on the Client Policy level, which will disable it for a given user or user group on any Gateway they connect to:

- 1 In the Parallels RAS Console, select the **Policies** category.
- 2 Right-click a policy and choose **Properties**.
- 3 Select the **Connection Properties** item in the left pane and then select the **Local Resources** tab in the right pane.
- 4 In the **Local devices and resources** section, clear the **Clipboard** option.

Note: Please note that when enabling or disabling the clipboard on a client policy level, this will also affect the clipboard functionality on desktop and mobile versions of Parallels Client. This means that if you disable the clipboard, the desktop and mobile device users will not be able to use their local clipboard when working with a remote application.

You can also disable the file upload and file download items on the toolbar. For instructions, please read the **Enabling or Disabling Remote File Transfer** section (p. 206).

HTML5 Gateway API

The HTML5 Gateway API allows you to use a custom app launcher to launch published applications and desktops via the RAS HTML5 Gateway.

Note: The **HTML5 Client** option must be enabled for the RAS Secure Client Gateway in the Parallels RAS Console and the gateway must be reachable on `https://server-name/RASHTML5Gateway/` where "server-name" is the name of the host server.

Link Format

When calling the following link:

`https://server-name/RASHTML5Gateway/?https://webserver.host/app.js#/launch`

the RAS HTML5 Gateway will make a request to `https://webserver.host/app.js` and expect a JSONP formatted response as follows:

```
_RASHTML5LoadApp ({
  u: 'username',
  q: 'password',
  a: '#3',
  p: 'c:\\temp\\another.txt',
  extra: {
    redirectPrinter: true,
    redirectLinks: true,
    redirectSound: true
  }
});
```

The RAS HTML5 Gateway will use the received data to launch the app using the options specified in the JSON payload.

Supported JSON Parameters

The following table lists currently supported parameters:

Parameter Name	Description
a	Application ID
d	Domain
p	Application arguments
q	Password
u	Username
extra.redirectLinks	Boolean: true = redirect links; false = do not redirect.
extra.redirectPrinter	Boolean: true = redirect printer; false = do not redirect.
extra.redirectSound	Boolean: true = redirect sound; false = do not redirect.

CHAPTER 11

Parallels RAS Web Portal

RAS Web Portal is a web page with auto client detection and a client distribution point. It provides access to published resources via a web browser.

Read on to learn how to install and configure a RAS Web Portal.

In This Chapter

RAS Web Portal: Prerequisites and Installation	151
Log In to RAS Web Portal.....	153
Farm Settings	154
General Settings.....	157

RAS Web Portal: Prerequisites and Installation

The RAS Web Portal allows users to launch published applications and desktops from different farms.

Requirements

- Windows Server 2008, 2008 R2, 2012, 2012 R2
- Microsoft .NET Framework 3.5 or 4.5
- ASP.NET role
- IIS 7.0 (Windows Server 2008) or IIS 7.5 (Windows Server 2008 R2)
- IIS 8.0 (Windows Server 2012) or IIS 8.5 (Windows Server 2012 R2)
- Parallels Remote Application Server

Supported Client Operating Systems and Browsers

	IE9	IE10	IE11	MS Edge	Chrome	FireFox	Safari
Windows Vista	●				●	●	●
Windows 7	●	●	●		●	●	●
Windows 8		●			●	●	●

Windows 8.1			●		●	●	●
Windows 10			●	●	●	●	●
Linux					●	●	●
macOS					●	●	●
iOS					●	●	●
Android					●	●	

Automatic Client Detection and Installation

	IE9	IE10	IE11	MS Edge	Chrome	FireFox	Safari
Windows Vista	●				●	●	●
Windows 7	●	●	●		●	●	●
Windows 8		●			●	●	●

Windows 10			●	●	●	●	●
Linux					●	●	●
macOS					●	●	●
iOS					●	●	●
Android					●	●	

Installation

We recommend that you do not install the RAS Web Portal on an Active Directory machine.

To install RAS Web Portal:

- 1 Run the `RASWebPortal.msi` or `RASWebPortal-x64.msi` file on the IIS machine that will be used as your access point to the published applications.
- 2 The **RAS Web Portal Setup** wizard opens.
- 3 Read the info on the **Welcome** page and click **Next**.
- 4 On the next page, read the End-User License Agreement. If agreed, select the **I accept the terms in the License Agreement** option and click **Next**.

- 5 On the **RAS Web Server Port** page, specify the port number. The RAS Secure Client Gateway is installed on port 80 by default and is configured to forward HTTP requests to the local host on port 81. Therefore, clients will still be able to access the RAS Web Portal on port 80. You can choose to install the RAS Web Service on any other port, and also use an existing port used by other web sites.
- 6 Click **Next** and then click **Install**.
- 7 Click **Finish** when the installation is completed.

Please note that IIS7 caches dynamic content as well as static content. To disable the caching for .aspx, .asmx and .ashx pages for the RAS Web Portal directory with an asp.net page that depends on the session state, perform the following on the **RAS Web Server**, **2XWebPortal**, and **2XWebService**.

Disabling Caching for folders consisting on .aspx, .asmx and .ashx

- 1 Run the Server Management console.
- 2 Navigate to **Roles > Web Server (IIS) > Internet Information Services**.
- 3 Repeat steps 4 to 12 for the following sites: **RAS Web Server**, **2XWebPortal**, and **2XWebService**.
- 4 Select the folder that contains the .aspx, .asmx and .ashx pages for which you need to disable caching.
- 5 In the **Feature View**, double-click **Output Caching**.
- 6 If there is a rule there already for the .aspx extension, double click it and continue from step 8. Otherwise right click and select **Add**.
- 7 Enter .aspx for the **File name extension**.
- 8 Check **User-mode caching**.
- 9 Select **Prevent all caching**.
- 10 Check **Kernel-mode caching**.
- 11 Select **Prevent all caching**.
- 12 Click **OK**.
- 13 Close the Server Management Console.

Log In to RAS Web Portal

After installing RAS Web Portal, open the following URL in a web browser:

`http://localhost/2XWebPortal/Admin.aspx`

Please Login

Username:

Password:

Secure Login ☐

Enter a user name and password of the user with administrative privileges and click **Log In** to log into the RAS Web Portal.

Farm Settings

The **Farm Settings** page allows administrators to add multiple farms so that users can launch published applications and desktop from the **User Logon** page.

User Logon Page Welcome Administrator | Logout

Parallels™ RAS Web Portal 🇬🇧 🇩🇪 🇷🇺 🇫🇷 🇯🇵 🇮🇹 🇪🇸 🇻🇪

RAS Web Portal - Console Online Manual **Farm Settings** General Settings

Farms
jb-w2k8r2-srv3....

RAS Web Portal allows users to launch published applications and desktops from multiple farms.

User with administrative rights on the Web Service machine are allowed to add farms from this interface. To add a new farm enter the IP or hostname of the RAS Secure Client Gateway and click "Add Farm". Further farm details can be configured once the farm has been added.

New settings will get activated once the Apply button has been pressed.

To add a farm, type the IP address or hostname of the RAS Secure Client Gateway and click **Add Farm**. The farm will be added to the left pane under the **List of Farms** tree.

Farm Details

The **Farm Details** page allows the administrator to configure properties. The following are the farm details for the selected farm. These settings are used for the RAS Web Service and the Parallels Client to connect to the RAS Secure Client Gateway.

Farm Details

These settings are used from the RAS Web Service and Parallels Client to connect with the RAS Secure Client Gateway of the selected farm.

RAS Secure Client Gateway Details:

Server Alias:

Primary Hostname / IP:

Secondary Hostname / IP:

Connection type:

Port:

Server Alias. Enter an Alias name that describes better the farm you added. The 'Alias' name gives the connection a display name for better readability.

Primary Hostname / IP. This setting is added automatically when adding the farm. This would be the IP / Hostname of the RAS Secure Client Gateway.

Secondary Hostname / IP. A secondary Hostname or IP can be added for another RAS Secure Client Gateway. If the 'Primary Hostname' fails, there would be a secondary RAS Secure Client Gateway which will provide published applications and desktops to the user.

Connection Type. This is automatically set to 'Direct Mode' when the farm is added. The connection mode is the method the RAS Web Service uses to connect to the RAS Secure Client Gateway. Set the connection mode to 'SSL mode' so that a secure connection is tunneled between the RAS Web Service and the RAS Secure Client Gateway.

Port. The default port number is set to port 80. The port must be the same as that set on the RAS Secure Client Gateway.

Advanced Settings

The **Advanced Settings** page is used to overwrite farm settings in the Parallels Client. This will change the settings in the Parallels Client without having the users tampering with the settings.

Set the advanced settings as described below.

Override RAS Secure Client Gateway IP/Host. Select the 'Override RAS Secure Client Gateway IP/Host' to override the 'Primary Hostname/IP' of the farm. Optionally, the **Secondary Hostname/IP** property can be specified.

Override Gateway Port. Select this setting to override the 'Gateway' port other than the default port 80.

Override SSL Gateway Port. Select this setting to override the 'Gateway SSL' port other than the default port 443.

Default Connection Mode. The connection mode for the farm can be overwritten from any of the following:

- **Auto** — The 'Connection Mode' will be set automatically depending on the connection settings configured on the farm.
- **Gateway Mode** — Clients are connected with the RAS Secure Client Gateway and the session connection is tunneled through the first available connection. This mode is ideal for servers which are only reachable via the gateway and do not require a high level of security.
- **Direct Mode** — Clients first connect to the RAS Secure Client Gateway for the best available Server and then connect directly with that particular Server. This is best used when the client and the server are on the same network.
- **Gateway SSL Mode** — Clients connect to the remote RAS Secure Client Gateway in a secure mode. The data being tunneled is encrypted for having a secure connection.
- **Direct SSL Mode** — Clients first connect to the RAS Secure Client Gateway using SSL for the best available server and then connect directly with that particular server. This is best when the client and the server are on the same network and high security safeguards are required.

Applying the Settings

After configuring the settings for a farm, you need to apply your changes by clicking the **Apply Settings** button.

Deleting a Farm

To delete a farm, select the farm in the list and then click **Delete Farm**.

General Settings

On the **General Settings** page, administrators can configure logging, session timeout and other security settings, and can customize the appearance of the Parallels RAS Web Portal. Parallels RAS Web Portal settings can be replicated to other servers for backup purposes. Administrators can also check for the available Parallels RAS Web Portal updates.

Logging

Administrators can enable logging on the Parallels RAS Web Portal so that they can trace changes being performed on the service.

Select **Enable Logging** so that the Parallels RAS Web Portal starts logging any activity that is performed.

You can refresh the log view by clicking the **Refresh** button.

To clear the log entries, click on **Clear Log** and the system will remove the previous logs from the log view.

A copy of current logs can be downloaded from the Parallels RAS Web Portal by clicking the **Download repository** button. By default, a compressed log file is backed up on a weekly basis so that administrators can backtrack any logs if needed. Please note that this function downloads all the available logs (not just the Web Service logs).

System Settings

System Settings are divided in two sections: **Logon settings** and **Security Settings**.

In the **Logon Settings** section, the **Session Timeout** option specifies the possible idle time that the Parallels RAS Web Portal logon and administrative pages can remain without interaction before the pages prompt the user that the session has timeout and they will be automatically logged off the Parallels RAS Web Portal. The session timeout value is set to 20 minutes.

The **Security Settings** enhance security when logging into Parallels RAS Web Portal and when connecting to a RAS Secure Client Gateway.

Security Settings

☒ Private Logon (User Data will be kept on the computer)

☐ Public Logon (No User Data will be kept on the computer)

☐ Show Public / Private Logon Options

☒ Enforce Security (HTTPS / SSL)

☒ Show Connection Mode Option

☒ Enable Favourites

☒ Enforce Advanced Client Security
When this option is enabled, no session settings are stored on the client. This option requires client version 10.1 or higher.

☒ Show Change Password option

☒ Enable Admin Page Security

localhost
172.22.2.1

Delete IP Address

Add IP Address

The security settings that can be set are described below.

Private Logon. Selecting this option will allow user data to be stored on the local computer. The data remains cached in the browser and will not be cleared when the user logs off the session.

Public Logon. Selecting this option will not allow user data to be stored on the local computer. The data will not remain persistent and will be cleared when the user logs off the session.

Show Public / Private Logon Options. Enable this option to allow the users to choose whether to connect as 'Public' or 'Private'. This option will be displayed on the Parallels RAS Web Portal User Logon Page.

Enforce Security (HTTPS / SSL). Enable this option to force the user to connect to the Parallels RAS Web Portal in SSL (HTTPS) mode. Users will not be allowed to connect to the 'Farm' if SSL is not enabled from the RAS Console.

Enable Favorites. Enable this option to show Favorites inside the User Logon Page.

Enforce Advanced Client Security. Enable this option, to only open the .2xa files when the user is logged on to the Parallels RAS Web Portal. Please note that a user cannot open the .2xa files when the Parallels RAS Web Portal session times out.

Show changed Password option. Enable this option, to show the 'Change Password' option on the User Logon Page.

Enable Admin Page Security. Enable this option so that administrators can only log into the Administrative Page from a machine that matches an IP address from the specified list. To add an IP Address, type it in the field provided and then click **Add IP Address**.

After configuring the System Settings, select **Apply Settings** so that the settings are saved.

Parallels Clients

To launch published applications and desktops, the Parallels Client needs to be installed on the Client. The Parallels RAS Web Portal can be configured to detect the Parallels Client automatically.

To detect Parallels Client Installation, select the **Client Detection** option.

If Parallels client detection fails, users can be notified by means of **Client Detection Failure Options**. The administrator can select from the following:

- **Show error message and allow retest.** Select this option so that an error message is shown and the user is allowed to perform a retest to detect the Parallels Client. This option will not provide the option to install the Parallels Client.
- **Show error message and allow installation or retest.** Select this option so that an error message is shown, providing the option to install the Parallels Client. The user can also choose to perform a retest to detect the Parallels Client.
- **Show error message and allow installation.** Select this option so that an error message is shown and an option is provided to install the Parallels Client. This option will not give the option to retest for Parallels Client detection.
- **Show error message only.** Select this option so that an error message is shown without providing the option to install or retesting for Parallels Client.

The Parallels Client can be downloaded for different OS platforms. The table below illustrates the platforms supported by the Parallels Client and the type of installation packages that can be downloaded for every OS.

OS	Installation Type	Description
----	-------------------	-------------

Windows	Full Client installation	This will perform the Parallels Client installation installing full resources.
	Basic Client installation	This will perform Parallels Client installation using minimal resources.
Linux	.deb package	This will download the Debian package from the Parallels website.
	.rpm package	This will download the RPM Package Manager from the Parallels website.
	.tar.bz2	This will download Parallels Client for Linux as a compressed file from the Parallels website.
Mac	.pkg	This will download Parallels Client from the Mac store and install it on the macOS desktop.
Android	.apk	This will download Parallels Client from the Google Play and install it on the Android device.
iOS		This will download Parallels Client from App Store and install it on the iOS device.

Customized Appearance

Customized appearance allows administrators to customize how the Parallels RAS Web Portal looks. Administrators can customize the Parallels RAS Web Portal by displaying a different company name, adding a custom banner, changing color themes and more.

To add settings to customize the appearance for Parallels RAS Web Portal, insert a friendly settings name inside the input text fields. Click **Add Settings** or press **Enter** to start customizing appearance settings.

The screenshot shows the 'General Settings' tab in the Parallels RAS Web Portal. At the top, there are tabs for 'Online Manual', 'Farm Settings', and 'General Settings'. Below the tabs are 'Delete' and 'Apply Settings' buttons. The main section is titled 'Customised Appearance' and contains the following text:

Customised Appearance allows administrators to add the customisation details for multiple logon screens.

Users with administrative rights on the Web Service machine are allowed to add customised appearance settings from this interface. To add a new setting, enter the Setting name and click "Add Setting". Further to that, a screen will be displayed prompting you to insert the Company Name, Company Logo and Message.

New settings will get activated once the Apply button has been pressed.

These settings are used to configure multiple logon screens.

Below the text, there are three input fields:

- Company ID:** A text box containing the word 'Personalised'.
- Display Company Name:** A text box containing the word 'Personalised'.
- Banner:** A large rectangular area showing a banner image with the Parallels RAS Web Portal logo. Below the image, it says: 'The image file should be in GIF format and ideally scaled to 300 X 40 pixels. Images larger than the mentioned preferred size, will be resized.'

At the bottom, there is a 'Choose File' button and a 'No file chosen' label.

You can customize settings as described below.

Company ID. This setting is set by default in the same name when creating settings to customize the appearance for the Parallels RAS Web Portal.

Display Company Name. Type in a name that you want to display as company name other than the default setting set when creating settings to customize appearance.

Banner. Custom banners can be added to the Parallels RAS Web Portal. The banner should be an image in GIF format, and a size of not more than 300 x 40 pixels.

To upload a banner click the "Browse" button and select the banner. Click "Upload" so that the banner will be uploaded to the RAS Web Service machine.

Message. To display a message underneath the logon section when logging into Parallels RAS Web Portal from the 'User Logon Page', type inside the input text field. This can be used to describe the customized Parallels RAS Web Portal.

URL. The URL states provides the link so that users can connect to the customized Parallels RAS Web Portal. This is automatically generated when creating new customized settings.

Note: The server which has the Parallels RAS Web Portal installation must be publicly accessible so that users can access the **User Logon** page.

Default Domain. Insert the default domain so that users will automatically log with the default domain when logging into the 'User Logon Page'.

Color Modification. From this section, administrators can configure the color scheme for every customized appearance. You can configure the colors by means of the color picker or color themes as illustrated below. More color themes can be created by picking other colors from the color picker. You can reset the Color Themes to default by clicking the **Reset** button.

Parallels RAS Publishing Agent

Parallels RAS Publishing Agent provides load balancing of published applications and desktops. A RAS Publishing Agent is automatically installed on a server on which you install Parallels Remote Application Server and is designated as the master Publishing Agent. Each site must have a master RAS Publishing Agent, but can have secondary agents added to it. The purpose of secondary agents is to ensure that users do not experience any interruption of the service due to a possible failure of the master RAS Publishing Agent. This chapter describes how to add RAS Publishing Agents to a site and how to configure them.

In This Chapter

Viewing and Configuring RAS Publishing Agents	163
Secondary Publishing Agents	165
Managing Secondary Publishing Agents.....	167

Viewing and Configuring RAS Publishing Agents

To view RAS Publishing Agents installed in a site, navigate to **Farm / Site / Publishing Agents** in the RAS Console. The installed Publishing Agents are listed on the **Publishing Agents** tab page in the right pane.

A site must have at least the master Publishing Agent installed, which is marked as "Master" in the **Priority** column. You can also add secondary agents to a site. We'll discuss secondary agents in the section that follows this one.

To modify the configuration of a RAS Publishing Agent:

- 1 Select a Publishing Agent, then click **Tasks** and choose **Properties**. The **Edit RAS Publishing Agent** dialog opens.
- 2 The **Enable Server in site** option is enabled for secondary Publishing Agents only. It is disabled for the master Publishing Agent.
- 3 The **Server** field specifies the FQDN or IP address of the server that hosts the RAS Publishing Agent.
- 4 The **IP** field specifies the server IP address. Click the **Resolve** button to obtain the IP address automatically using the FQDN specified in the **Server** field. This IP address is used so that multiple Publishing Agents share information in real time.

- 5 The **Alternate IPs** field specifies one or more alternate IP addresses separated by a semicolon. These addresses will be used if RAS Secure Client Gateways fail to connect to the RAS Publishing Agent using its FQDN or the address specified in the **IP** field. This can happen, for example, if Gateways are connecting from a network which is not joined to Active Directory.
- 6 The **Description** field can be used to enter a user-defined description.
- 7 When you are done making the changes, click **OK** to save them and then click **Apply** in the main RAS console window.

The **Tasks** drop-down menu on the **Publishing Agents** tab page has the following additional items:

- **Add.** Adds a secondary RAS Publishing Agent to the site. See the section that follows this one for more information.
- **Check Agent.** Verifies that the RAS Publishing Agent installed on the server is functioning properly. It opens a dialog where you can see the verification results and optionally install (or uninstall) the Publishing Agent software on the server.
- **Promote Secondary to Master.** Promotes a secondary Publishing Agent to master. Use this option if you would like to make a different server to be the master Publishing Agent. The current master becomes a secondary RAS Publishing Agent.
- **Delete.** Deletes a selected secondary Publishing Agent from the site. To delete the master Publishing Agent, you first need to promote a secondary Publishing Agent to master.
- **Move Up** and **Move Down.** Changes the priority of a secondary Publishing Agent (moves it up or down in the priority list).
- **Logging.** Enables extended logging (normal logging is used by default). Also allows you to retrieve logs into a local file and clear all logs.

Viewing RAS Publishing Agent Overview

In addition to the Publishing Agent editor described above, you can also see the summary about the available RAS Publishing Agents. To do so:

- 1 In the RAS Console, select the **Farm** category and then select the **Site** node in the middle pane.
- 2 The available RAS Publishing Agent servers are displayed in the **Publishing Agents** group in the right pane.
- 3 To go to the Publishing Agents editor, right-click a server and choose **Show in the Editor**.

For additional info, see **Viewing Sites in the RAS Console** (p. 33).

Secondary Publishing Agents

To ensure users do not experience an interruption of the service due to a failure of the master RAS Publishing Agent, one or more secondary Publishing Agents can be added to a site. With one or more secondary agents installed, the runtime data is replicated on each agent, so if any service fails, the downtime is reduced to a minimum. In addition, any active RAS Publishing Agent will be used for authentication purposes with both the AD and any 2nd level authentication provider used.

The master RAS Publishing Agent performs the same tasks as secondary Publishing Agents but has additional responsibilities. It manages certain processes that have to be managed by a single Publishing Agent. The following table lists processes managed by the master Publishing Agent and secondary Publishing Agents:

Process	Master Publishing Agent	Secondary Publishing Agents
Monitor PAs (counters)	Yes	Yes
Monitor RD Session Hosts (counters)	Yes	Yes
Monitor VDI Hosts (counters)	Yes	Yes
Monitor TS Sessions (reconnection)	Yes	Yes
Monitor Deployed TS applications	Yes	Yes
Monitor VDI session (reconnections)	Yes	Yes
Manage system settings	Yes	No
Send licensing information & heart beat	Yes	No
Process and send CEP information	Yes	No
Send information to reporting server	Yes	No
Manage TS scheduler	Yes	No
Reporting engine information	Yes	Future versions
Shadowing	Yes	Future versions
Send email notifications	Yes	No

As a demonstration of how load distribution between multiple Publishing Agents works, consider the following example:

- Suppose we have two Publishing Agents: PA1 (master) and PA2 (secondary).

- Suppose we also have 10 RD Session Hosts: TS1, TS2 ... TS10

The resulting load will be distributed as follows:

- TS1, TS2 ... TS4 will use PA1 as their preferred Publishing Agent.
- TS5, TS6 ... TS10 will use PA2 as their preferred Publishing Agent.

Planning for secondary publishing agents

RAS Publishing Agents running on the same site communicate with each other and share the load. The amount of data being transmitted from one agent to another is quite large, so a reliable high-speed communication channel must be ensured (e.g. a subnetwork can be configured for Publishing Agent communications).

When adding a secondary Publishing Agent to a site, you specify an IP address for it. Make sure that the IP addresses of all agents belong to the same network segment. The port that Publishing Agents use to communicate with each other is TCP 20030.

There's no physical limit to how many Publishing Agents you can add to a site. However, the best results are achieved with only 2-3 agents present (the two-agent scenario is recommended).

Note: Adding more than 2-3 secondary Publishing Agents to a site may have a reverse effect and actually degrade the system performance.

Adding a secondary RAS Publishing Agent to a site

To add a secondary RAS Publishing Agent:

- 1 In the RAS console, navigate to **Farm / Site / Publishing Agents**.
- 2 Click the **Tasks** drop-down menu and choose **Add** to launch the **Add RAS Publishing Agent** wizard.
- 3 The **Server** field specifies the FQDN or IP address of the server that hosts the RAS Publishing Agent.
- 4 The **IP** field specifies the server IP address. Click the **Resolve** button to obtain the IP address automatically using the FQDN specified in the **Server** field.
- 5 The **Alternative IPs** field specifies one or more alternative IP addresses, separated by a semicolon. These addresses will be used if RAS Secure Client Gateways fail to connect to the RAS Publishing Agent using it's FQDN or the address specified in the **IP** field. This can happen, for example, if Gateways are connecting from a different network, which is not joined to Active Directory.
- 6 Select the **Install a gateway with a publishing agent** option if you also want to install a RAS Secure Client Gateway on the specified server. If you select this option, you may also select the **Add an SSL certificate and enable HTML5 Gateway** option (for more info, please see **Enable HTML5 Support on the Gateway** (p. 131)).

- 7 Select the **Add Firewall Rules** option to automatically configure the firewall on the server. See **Port Reference** (p. 252) for details.
- 8 Click **Next**.
- 9 On the next page, click **Install** to install the RAS Publishing Agent on the server. The **Installing RAS Redundancy Service** dialog opens.
- 10 Select the server on which the RAS Publishing Agent is to be installed and click **Install**.
- 11 Click **Done**.
- 12 Click **OK** to add the server to the farm.

Managing Secondary Publishing Agents

Enabling or Disabling a Secondary Publishing Agent

To enable or disable a secondary Publishing Agent on a site, select it in the **Publishing Agents** list and then select or clear the check box at the beginning of the row.

Changing the Secondary Publishing Agent Priority

Each RAS Publishing Agent in the list is given a priority. By default, the local RAS Publishing Agent is given the master priority which cannot be changed. To change the priority of other Publishing Agents in the farm, select a Publishing Agent and use the Move Up and Move Down buttons to move it up or down the list. The higher it is in the list, the higher the priority.

Promoting a Secondary Publishing Agent to the Master Publishing Agent

If the master Publishing Agent cannot be recovered, you can promote a secondary Publishing Agent to master as follows:

- 1 Open the Parallels Remote Application Server Console on the server that you would like to promote (all required files are automatically installed when a server is added to a site as a secondary RAS Publishing Agent).
- 2 Select the **Farm** category and navigate to the **Publishing Agents** node.
- 3 Select the RAS Publishing Agent and then click **Promote Secondary to Master** in the **Tasks** drop-down menu.
- 4 Click **OK** once the process is finished.

Deleting a Secondary Publishing Agent

To delete a secondary Publishing Agent, select it in the list and then click **Delete** in the **Tasks** drop-down menu.

Load Balancing

This chapter describes load balancing options that you can use in Parallels Remote Application Server.

In This Chapter

Resource Based & Round Robin Load Balancing	168
Load Balancing Advanced Settings	170
High Availability Load Balancing	170

Resource Based & Round Robin Load Balancing

Load Balancer is designed to balance RDS and VDI host connections made from Parallels Clients.

The following types of load balancing methods are available:

- **Resource Based.** Distributes sessions to servers depending on how busy the servers are. Therefore a new incoming session is always redirected to the least busy server.
- **Round Robin.** Redirects sessions in sequential order. For example, the first session is redirected to server 1, the second session is redirected to server 2, and the third session is redirected to server 1 again when there are two RD Session Host servers in the farm.

Both methods are explained in this and the following subsections.

Load Balancing options can be configured from the **Load Balancing** category in the RAS Console.

Enabling Resource Based Load Balancing

Load balancing is enabled by default when more than one server is available in a site. The resource-based load balancing is the default method.

To switch back to resource-based from round-robin, select **Resource Based** in the **Method** drop-down list.

Configuring Resource Counters

Resource-based load balancing uses the following counters to determine if a server is busier than the other/s and vice versa:

- **User sessions.** Redirect users to a server with the least number of sessions
- **Memory.** Redirect users to the server with the best free/used RAM ratio
- **CPU.** Redirect users to the server with the best free/used CPU time ratio

When all of the counters are enabled, the RAS Load Balancer adds the counter ratios together and redirects the session to the server with the most favorable combined ratio.

To remove a counter from the equation, clear the checkbox next to the counter name in the **Counters** section.

Round Robin Load Balancing

Round-robin load balancing redirects sessions in sequential order. For example, with two RD Session Host servers in the farm, the first session is redirected to server 1, the second session is redirected to server 2, and the third session is redirected to server 1 again. To enable round-robin load balancing, select **Round Robin** in the **Method** drop-down list.

Session Options

Reconnect to Disconnected Sessions. Enable this option to redirect incoming user sessions to a previously disconnected session owned by the same user.

Reconnect sessions using client's IP address only. When reconnecting to a disconnected session, the Parallels Remote Application Server will match the username requesting reconnection with the username of the disconnected session to match the sessions. With this option enabled, Parallels Remote Application Server will determine to which disconnected session to reconnect the session by matching the source IP address.

Limit user to one session per desktop. Enable this option to ensure that the same user does not open multiple sessions. Please note that for this option to work, your RD Session Hosts must also be configured to restrict each user to a single session. In Windows Server 2008, you need to enable the "Restrict each user to a single session" option in Remote Desktop Session Host Configuration. In Windows Server 2012(R2), it's the "Restrict Remote Desktop Services users to a single Remote Desktop Services session" option in Local Group Policy \ Remote Desktop Services \ Remote Desktop Session Host \ Connections.

Disable Microsoft RD Connection Broker. If this option is enabled, the Microsoft RD Connection Broker will not interfere with the RAS brokering done by the RAS Publishing Agent if it is installed. Please note that this option will only work with Windows Server 2012 and above.

Load Balancing Advanced Settings

Excluding a Process from the CPU Counter

To exclude a process so it does not affect the free/used CPU time ratio on a server, follow the procedure below:

- Click the **Configure** button at the bottom of the **Load Balancing** options.
- Select the **Enable CPU Load Balancer** option and click **Exclude List**.
- Click **Add** to select a process in the list of running processes. Alternatively you can specify a process name in the **Please Enter Process Name** input field at the bottom of the dialog.
- Click **OK** to close the **Processes Exclude List** dialog or **Add** to add other processes.

To remove a process from the processes excluded list highlight the process and click **Remove**.

High Availability Load Balancing

High Availability Load Balancing (HALB) is an appliance that provides load balancing for RAS Secure Client Gateways. A Parallels HALB appliance is a preconfigured virtual machine with the operating system installed and all relevant settings configured.

Parallels HALB appliance is available for the following hypervisors:

- Microsoft Hyper-V
- VMware
- Citrix XenServer

HALB deployment in Parallels RAS is per site, which means that a site must have at least one Parallels HALB appliance deployed. Since HALB is a single point of contact for the client software, it is recommended to have at least two HALB appliances per site for redundancy.

Multiple HALB deployments can run simultaneously, one acting as the master and others as slaves. The more HALB deployments a site has, the lower the probability that end users will experience downtime. Master and slave HALB deployments share a common or virtual IP address (VIP). Should the master HALB deployment fail, a slave is promoted to master and takes its place.

Note: Please note that when a slave HALB deployment is promoted to master, a user will experience two disconnects: one when the master HALB deployment goes down and one more time when it goes back up since VIP moves from one deployment to the other.

Setting up High Availability Load Balancing consists of the following steps:

- 1** Deploying a Parallels HALB appliance.

2 Configuring HALB in the RAS console.

Read on to learn how to download and deploy a Parallels HALB appliance.

Deploying a Parallels HALB Appliance

To download a Parallels HALB appliance, visit <https://www.parallels.com/products/ras/download/links/>

On the **Download Parallels Remote Application Server** web page, scroll down to the **Download Optional Server Components** table and find the **Parallels Remote Application Server HALB Appliances** row. The row contains the following download links:

- HALB Appliance OVA
- HALB Appliance VHD
- HALB Appliance VMDK

The appliance type that you need to download depends on the hypervisor that you are using. Please follow the instructions below for your hypervisor type.

VMware

For VMware, the appliance can be imported with either the OVA or zipped VMDK appliance file. If deployed via the OVA file, the VM is created already configured.

Alternatively, deployment via the VMDK file deploys the VM without preconfigured specifications. The minimum specifications for this VM are outlined below:

- One CPU
- 256 mb RAM
- One network card

Microsoft Hyper-V

For Microsoft Hyper-V, the appliance is imported with the VHD file.

Citrix XenServer

For XenServer, the appliance can be imported with either OVA, VMDK, or VHD file.

Deploying a Parallels HALB appliance

After you download a Parallels HALB appliance, you need to import it to a hypervisor running on a separate machine connected to the same local network as Parallels RAS. For the information on how to import a virtual appliance, please consult your hypervisor documentation.

Once the appliance is deployed, you can add it to a Parallels RAS farm. Read on to learn how to do it.

Configuring HALB in the RAS Console

To configure High Availability Load Balancing in the RAS console, navigate to **Farm / Site / HALB**. On the **HALB** tab page in the right pane, select the **Enable HALB** option. This will enable the remaining options and will also show the **Devices** tab page. Configure the options on each tab page as described below.

HALB tab page options

Set the **Virtual IP** address options as follows:

- Select the IP version (IPv4, IPv6, or both) that you would like to use.
- Specify the IP address (or addresses if both version are selected) and their corresponding property (subnet mask, prefix). This is the IP address that clients will connect to. This will also be a floating IP address used by this and other HALB appliances.

Select the **LB Gateway Payload** option to load-balance normal gateway connections and then click **Configure**.

- 1 In the **HALB Configuration** dialog, specify the port number that will be used by HALB appliances to forward traffic to gateways (the port configured on the gateway).
- 2 Select the gateways that the HALB appliance will load-balance.
- 3 Click **OK** to close the **HALB Configuration** dialog and return to the **HALB** tab page.

If required, select the **LB SSL Payload** option to load-balance SSL connections and then click **Configure**.

- 1 In the the **HALB Configuration** dialog, specify the port number that will be used by HALB appliances to forward traffic gateways (443 by default).
- 2 In the **Mode** drop-down list, select **Passthrough** or **SSL Offloading** to specify where the SSL decryption process is performed. By default, the SSL connections are tunneled directly to the gateways (referred to as passthrough) where the SSL decryption process is performed.

If you select the **SSL Offloading** mode, click **Configure**. The **SSL** dialog opens.

The SSL Offloading mode requires an SSL certificate to be installed on HALB appliances. Specify the following options in the **SSL** dialog to generate a new certificate:

- **Accepted SSL Versions.** Select an SSL version.
- **Cipher Strength.** Select the cipher strength of your choice. To specify a custom cipher, select **Custom** and then specify the cipher in the **Cipher** field.

Click **Generate new certificate** and enter the required details. The **Private Key file** and **Certificate file** options are populated automatically.

Alternatively, click **Generate certificate request**, fill in the details and click **Save** to bring up the certificate request window. Click **Copy** to copy the request. This certificate request should be sent to a certificate authority. Once you receive an SSL certificate from the certificate authority, click the **Import public key** button and select the certificate file containing the public key.

- 3 In the **HALB Configuration** dialog, select the gateways that the HALB appliance will load-balance and click **OK** to close the dialog.

Configure the remaining properties on the **HALB** tab page:

- 1 Select the **Client Management** option to enable management of Windows devices connected through HALB.
- 2 Select the **Enable RDP UDP Data Tunneling** option to enable UDP tunneling on Windows devices.
- 3 The **Maximum sessions per device** property specifies the maximum number of simultaneous connections allowed. Use the default value or specify your own.

Devices tab page options

Click the **Devices** tab to add HALB appliances that will be managed by this farm. To add appliances:

- 1 Click **Tasks > Add** (or click the **+** icon) to bring up the **Add HALB Devices** dialog. Parallels RAS is capable of detecting HALB appliances over the network and display them as a list. Selecting detected HALB appliances from this list is the preferred method for adding new appliances. If an appliance cannot be detected, you can add it manually by specifying the appliance IP address in the **IP Address** field.
- 2 Click **OK** to close the **Add HALB Devices** dialog. The appliance is initialized and added to the list on the **Devices** tab page.
- 3 Finally, click **Apply** for the new HALB configuration to be applied to all added HALB appliances.

For additional information, please see the following KB article: <http://kb.parallels.com/123607>

Changing HALB Appliance Password

When the HALB configuration console shown above closes, login credentials are requested to log back in. Follow the steps below to set login credentials for the HALB device:

- 1 Boot the Appliance.
- 2 Press the <ALT> – <F1> key combination. A login prompt should be displayed.

```
Debian GNU/Linux 7 LB-00-0C-29-DA-92-7A tty1
LB-00-0C-29-DA-92-7A login: root
Password: _
```

- 3 Type in the following credentials:

- **login** – root
- **password** – Pa\$\$w0rd (note that "0" is zero, not the letter "O").

```
Debian GNU/Linux 7 LB-00-0C-29-DA-92-7A tty1
LB-00-0C-29-DA-92-7A login: root
Password:
Linux LB-00-0C-29-DA-92-7A 3.2.0-4-686-pae #1 SMP Debian 3.2.51-1 i686
Welcome to Lb-00-0c-29-da-92-7a, 2X HALB / Debian 7.2 Wheezy

System information (as of Fri Apr 17 09:47:25 2015)

System load: 0.03          Memory usage: 13%
Processes: 63             Swap usage: 0%
Usage of /: 71.5% of 494MB IP address for eth0: 10.124.4.119

root@LB-00-0C-29-DA-92-7A ~# passwd_
```

- 4 Once logged in, execute the password changing command by typing a password.

```
root@LB-00-0C-29-DA-92-7A ~# passwd
Enter new UNIX password: _
```

- 5 Type in and confirm the new password.

Upon completion, you may log in to the HALB device with the new password set after the HALB configuration console is closed.

CHAPTER 14

Universal Printing

Printer redirection enables users to redirect a print job from a remote application or desktop to their local printer, which can be connected to the user's computer or be a local network printer attached via an IP address. RAS Universal Printing simplifies the printing process and solves most printer driver issues by eliminating the need for a remote server to have a printer driver for a specific local printer on the client side. Therefore, a user can print regardless of which printer they have installed locally, and the RAS administrator doesn't have to install a printer driver for each printer connected to the local network.

This chapter describes how to configure and use RAS Universal Printing services.

In This Chapter

Managing Universal Printing Servers.....	175
Universal Printing Filtering.....	176
Font Management.....	177

Managing Universal Printing Servers

To configure RAS Universal Printing, select the **Universal Printing** category in the RAS Console.

By default, the Universal Printing driver is automatically installed together with an RD Session Host Agent, VDI Guest VM Agent, or a Remote PC Agent. Therefore, upon adding a server to the farm, the Universal Printing is already enabled. The Universal Printing driver is available as a 32 bit and 64 bit version.

Enabling and Disabling Universal Printing Support

To enable or disable the Universal Printing support for a server, right-click the server in the **Servers in Site** list and click **Enable** or **Disable** in the context menu.

Configuring a Printer Renaming Pattern

By default, Parallels Remote Application Server renames printers using the following pattern: **%PRINTERNAME% for %USERNAME% by RAS**. For example, let's say a user named Alice has a local printer named Printer1. When Alice launches a remote application or desktop, her printer is named **Printer1 for Alice by RAS**.

To change the default printer renaming pattern, specify a new pattern in the **Pattern** input field. To see the predefined variables that you can use, click the [...] button next to the **Pattern** input field. The variables are:

- **%CLIENTNAME%** — the name of the client computer.
- **%PRINTERNAME%** — the name of a printer on the client side.
- **%USERNAME%** — the name of the user connected to RAS.
- **%SESSIONID%** — RAS session ID.
- **<2X Universal Printer> Legacy mode** — This means that only one printer object will be created in the RDP session.

You can also use certain other characters in a printer renaming pattern. For example, you can define the following commonly used pattern: **Client/%CLIENTNAME%#/%PRINTERNAME%**. Using this pattern (and the user named Alice from the example above), a local printer will be named **Client/Alice's Computer#/Printer1**

You can specify a different printer renaming pattern for each server in the **Servers in Site** list.

Note: Redirected printers are only accessible by the administrator and the user who redirected the printer.

Universal Printing Filtering

A system administrator can control the list of client-side printer drivers which should be allowed or denied the Universal Printing redirection privileges.

Using this functionality you can:

- Avoid server resource overloading by non-useful printer redirection. Since the majority of users choose to redirect all local printers (this is default setting), a large number of redirected devices is created on the server which are not really used. It's mostly related to various paperless printers like PDFCreator, Microsoft XPS Writer, or various FAX devices.
- Avoid server instability with certain printers. There are some printers that might create server instability (spooler service component) and as the result deny printing services as a whole for all connected users. It is very important that the administrator has the ability to include such drivers to the "deny" list to continue running printing services.

To specify printer filtering:

- 1** In the Parallels Remote Application Server Console, navigate to **Universal Printing / Printer Drivers**.
- 2** In the **Mode** drop-down list, select which printers should be allowed redirection from the following options:

- **Allow redirection of printers using any driver** — (default) This option places no limitation on the the type of driver a printer is using to use redirection privileges.
- **Allow redirection of printers using one of the following drivers** — Only the printers using the drivers listed in the box below the **Mode** field are allowed redirection. To add a printer driver to the list, click the **Tasks > Add** (or click the **+** icon) and type the printer driver name in the edit field provided.
- **Don't allow redirection of printers that use one of the following drivers** — This is probably the most useful option in the context of this feature. The printers that use the drivers specified in the list will be denied redirection privileges. All other printers will be allowed to use redirection. To add a printer driver to the list, click the **Tasks > Add** (or click the **+** icon) and type the printer driver name in the edit field provided.

3 To delete a printer driver from the list, click **Tasks > Delete** or click the minus-sign icon.

4 When done making changes, click the **Apply** button to save the changes.

Please make a note of the following:

- When adding a printer driver to the list, type the printer *driver* name, NOT the printer name.
- The driver names comparison is case insensitive and requires full match (no partial names, no wildcards).
- The settings that you specify on this tab page affect the entire site (not an individual server).

Font Management

Fonts need to be embedded so that when printing a document using Universal Printing the document is copied to the local spooler of the client machine to be printed. If the fonts are not present on the client machine the print out would not be correct.

To control the embedding of fonts within a print job use the **Fonts Management** tab page and check/uncheck the option **Embed Fonts**.

Excluding Fonts from Embedding

To exclude a specific font type from being embedded, click **Tasks > Add** in the **Exclude the following Fonts from embedding** section and select a font from the list.

Automatically Install Fonts on Servers and Clients

To automatically install a specific font type on servers and clients, click **Tasks > Add** in the **Auto install fonts** section and select the fonts from the list.

Note: By default, fonts added to the auto install list will be excluded from the embedding list because the fonts would be installed on the Windows clients, therefore there is no need for them to be embedded. Clear the option **Automatically exclude font from embedding** in the select font dialog so the font is not excluded from the embedding list.

Resetting List of Excluded Fonts to Default

To reset the list of excluded fonts to default, click **Tasks > Reset to Default**.

You can also specify a universal printing compression policy. For more info see **Client Policies / Experience** (p. 199).

Universal Scanning

Scanner redirection enables users who are connected to a remote desktop or accessing a published application to make a scan using the scanner that is connected to the client machine. This chapter describes how to configure and use RAS Universal Scanning services.

In This Chapter

Managing Universal Scanning.....	179
Managing Scanning Applications.....	180

Managing Universal Scanning

Universal Scanning uses TWAIN and WIA redirection to let any application using either technology hardware connected to the client device for scanning. With Universal Scanning there is no need to install a specific scanner driver on the server. Only one scanner is shown on the server regardless of the number of users and sessions currently in use on the RD Session Host.

Note: The server feature **Desktop Experience** is required in order to enable both WIA and TWAIN scanning on RD Session Hosts.

To configure Universal Scanning, select the **Universal Scanning** category in the RAS Console.

By default, the Universal Scanning driver is automatically installed with the RD Session Host, Guest VM, and Remote PC agents. Therefore, upon adding a server to the farm the Universal Scanning is installed.

Note: The Universal Scanning driver is available as a 32 bit and 64 bit version. Currently, only 32 bit applications are supported.

Configuring a Scanning Rename Pattern

By default, Parallels Remote Application Server renames scanners using the following pattern: **%SCANNERNAME% for %USERNAME% by RAS**. For example, if a user named Lois, who has SCANNER1 installed locally, connects to a remote desktop or published application, her scanner is renamed to "SCANNER1 for Lois by RAS".

To change the pattern used to rename scanners, specify a new pattern in the **Scanner rename pattern** input field. The variables that you can use for renaming are:

- **%SCANNERNAME%** — client side scanner name.
- **%USERNAME%** — username of the user connected to the server.
- **%SESSIONID%** — ID of the active session.

You can configure a different renaming pattern specifically for each server in the list.

Note: Redirected scanners are only accessible by administrator and the user who redirected the scanner.

Enabling and Disabling Universal Scanning Support

To enable or disable the WIA or Twain Universal Scanning support for a particular server, click the **WIA** tab or the **TWAIN** tab, then right-click a server and click **Enable** or **Disable** in the context menu.

Managing Scanning Applications

Adding a Scanning Application

TWAIN applications that will use the Universal Scanning feature have to be added in the TWAIN tab by selecting the **TWAIN Applications** button so they can use the Twain driver, hence making it easier for the administrator to set them up.

To add an application to the list of scanning applications:

- 1 With the **Universal Scanning** category selected in the RAS Console, click the **TWAIN** tab.
- 2 Click the **Twain Applications** button (below the **Servers in Site** list) and then click **Add**.
- 3 In the **TWAIN Applications** dialog, click **Tasks > Add** and browse for the application executable. Select the executable and click **Open**.

Note: Some applications might use different or multiple executables. Make sure that all required executables are added to the list of scanning applications.

Deleting a Scanning Application

To delete a scanning application from the list, highlight it and click **Tasks > Delete**.

Note: If you delete an application from the list, the installation of the application will not be affected.

You can also specify a universal scanning compression policy. For more info see **Client Policies > Experience** (p. 199).

CHAPTER 16

User Device Management

This chapter describes tasks that a Parallels RAS administrator can perform to manage user devices, such as desktop computers and phones or tablets.

In This Chapter

Inviting Users to Connect to Parallels RAS.....	181
Enabling Help Desk Support.....	181
Monitoring Devices.....	182
Windows Device Groups.....	183
Managing Windows Devices.....	184
Scheduling Windows Devices & Groups Power Cycles.....	191
Managing Client Policies.....	192
Enabling or Disabling Remote File Transfer	206

Inviting Users to Connect to Parallels RAS

Parallels Remote Application Server supports multiple platforms ranging from desktop PCs and Mac computers to mobile devices and ChromeApps. The Invitation Email feature is designed to reduce the complexities involved in the installation and client rollout process. This feature allows the administrator to send client installation and automatic configuration instructions to end users right from the Parallels RAS Console.

Before proceeding, please confirm that you've configured the mailbox as described in **Configuring SMTP Server Connection for Notifications via Email** (p. 244).

To send an invitation email to users, use the **Start** category in the RAS Console. For the detailed description, please refer to the **Setting Up a Simple RAS Environment** section (p. 23).

Enabling Help Desk Support

Parallels Client provides users with the ability to send a support request, together with a problem report, to your organization's help desk.

Note: At the time of this writing, this functionality is only available in Parallels Client for iOS and Parallels Client for Android. Support for other clients will be added in future releases.

To enable Help Desk support, do the following:

- 1 In the RAS Console, select the **Features** category.
- 2 Select the **Enable Helpdesk functionality in Parallels Client** option and specify your help desk email address in the field provided. This email address will be updated in Parallels Client every time a user connects to Parallels RAS from it.

Help desk can be accessed in Parallels Client from the Help section (or menu). When the user selects the **Request support from helpdesk** item, a local email client will open. The following information will be prefilled in the email:

- Help desk email address (the one you set in the RAS Console).
- Application name.
- A screenshot.
- User name.
- Application version.
- Operating system version.

The user can provide their own description of the request.

Monitoring Devices

Device monitoring allows you to view devices which are connected to the farm or have established a connection at least once in the past. To monitor devices, select the **Client Manager** category in the Parallels RAS Console and click the **Devices** tab. The information for a device includes:

- Device name
- IP address
- State (see below for the list of states)
- Last user (who used a device)
- MAC address
- OS version
- Parallels Client version
- Group (if a device is a member of a device group)
- Gateway (the RAS Secure Client Gateway a device is connected to)

To see the additional device information, right-click a device and choose **Get Device Information** in the context menu. In the dialog that opens, review the following properties:

- **Name:** Device name.
- **IPs:** Device IP address (or multiple addresses if applicable).

- **MAC Address:** MAC address.
- **State:** State (see below for the list of states).
- **Last User:** The user who logged in from this device the last time.
- **Last Logon Time:** The time of last logon.
- **OS Version:** The operating system version running on the device.
- **Client Version:** Parallels Client version installed on the device.
- **Gateway Name:** RAS Secure Client Gateway through which the device connect to Parallels RAS.
- **Last Activity:** The date and time when any activity was detected from this device.

Device States

Devices that connect to Parallels RAS can have any of the following states:

- **Off:** Device is switched off.
- **Connected:** Device is connected.
- **Logged On:** Devices is logged on to the system.
- **Standalone:** Device has previously connected to the Parallels Remote Application Server but is not using Parallels Client, therefore it cannot be managed.
- **Not Support:** Device is not supported by the Parallels Remote Application Server.
- **Foreign Managed:** Connecting to the farm but managed by a different farm.
- **Not Manageable:** Client not manageable due to incompatible client version or uninstalled component.
- **Locked.** Device has an active session in locked status.
- **Pair Pending.** Connection should be refreshed on the client side; port UDP 20009 is blocked from the client to gateway; client management port is disabled on the gateway

Windows Device Groups

The **Windows Device Groups** tab page (**Client Manager** category) allows you to group managed Windows devices and administer them together.

Creating a Windows Device Group

To create a Windows Device Group:

- 1 Navigate to the **Windows Devices Groups** tab in the **Client Manager** category and click **Tasks > Add**.
- 2 On the **Main** tab page, specify a group name and an optional description.

3 On the **OS Settings** tab page, set the following options:

- **Disable removable drives.** Disable mounting of removable drives on managed Windows device.
- **Disable Print Screen.** Disable the **Print Screen** key.
- **Replace desktop.** This feature makes a Windows computer behave like a thin client. It limits users from changing system settings or installing new applications. The administrator can add local apps (which are already installed on a computer) to the app list in addition to published resources from Parallels RAS. If you select this option, specify an administrator password in the **Admin Mode Password** field (below) to be used to switch a computer between user and admin modes.
- **Kiosk mode.** Enable the kiosk mode. This will disable power cycling functions (reboot, shutdown) on computers in the group.
- **Use client as desktop.** If this option is selected, Parallels Client will run in full screen mode. A user will not be able to minimize it. Select this option to overcome an issue with Parallels Client breaking out of the kiosk mode on Windows 8.x. The issue may manifest itself in the tile-based UI or while using the "drag to close" feature.
- **Admin Mode Password.** Specify a password to switch between user and admin modes when a Windows desktop is replaced (see **Replace desktop** above).

4 On the **Firewall Settings** tab page, add the inbound ports if necessary.

5 On the **Shadowing** tab page, select the **Request Authorization** option to prompt a Windows device user before remotely controlling their desktop. If enabled, the user can choose to decline the connection. For more information, see **Managing Windows Devices** (p. 184).

Adding a Windows Device to a Group

To add a Windows device to a group:

- 1** Navigate to the **Client Manager / Devices** tab page.
- 2** Right-click a managed Windows device and choose **Move to Group** in the context menu.
- 3** Select a group and click **OK** to save the settings.

The administrator can now perform standard Windows power operations (Power On, Power Off, Reboot, Logoff, Lock) on groups of devices.

Managing Windows Devices

The Client Manager feature allows the administrator to convert Windows devices running Windows XP up to Windows 10 into a thin-client-like OS. In order to be managed, Windows devices must be running the latest version of Parallels Client for Windows.

Read the instructions below to learn how to set up Parallels Client on a Windows computer and how to enroll and manage it in Parallels RAS.

Install Parallels Client on a Windows Computer

To install and configure Parallels Client for Windows, follow the steps below. You can also read the **Parallels Client for Windows User's Guide** for the complete instructions on how to install and configure Parallels Client.

- 1 Download the Parallels Client for Windows from <https://www.parallels.com/products/ras/download/client/>
- 2 Double click the **RASClient.msi** or **RASClient-x64.msi** and follow the on-screen instructions to complete the installation wizard.
- 3 Create a new Parallels RAS connection by clicking **File > Add New Connection**.
- 4 Select **Parallels Remote Application Server** and click **OK**.
- 5 Next, configure the following connection properties:
 - **Primary Connection** — Specify the Parallels Remote Application Server FQDN or IP address.
 - **User Credentials** — Enter username, password, and domain.
- 6 Click **OK** to create the connection and then double-click it to connect to Parallels Remote Application Server.

Upon completion, the Windows device will appear in the Parallels RAS Console in **Client Manager / Devices**.

Windows Device Enrollment

You can configure Parallels RAS to enroll a Windows device automatically or you can opt to do it manually.

To manually enroll a Windows device in Parallels RAS:

- 1 In the RAS Console, navigate to **Client Manager / Devices**.
- 2 Select a device on the **Devices** tab page.
- 3 Click **Tasks > Manage Device**.

The device state will change to **Pair pending** until the device reconnects. Ensure the **Client Manager Port** option is enabled for a gateway. To verify this:

- 1 Navigate to **Farm / Site / Gateways**.
- 2 Select a gateway and click **Tasks > Properties**.
- 3 Click the **Network** tab and make sure that the **Client Manager Port** option is selected

Once the device reconnects, the enrollment process is complete and the device state is updated to **Logged On**, which indicates that it's now managed by Parallels Remote Application Server. The user running Parallels Client on their Windows PC can also verify that the PC is managed by clicking **Help > About** on the main Parallels Client menu. The information includes the RAS Secure Client Gateway information that the Parallels Client uses to communicate with Parallels RAS.

You can also set Parallels Remote Application Server to automatically manage Windows devices. To do so:

- 1 In the RAS Console, select the **Client Manager** category.
- 2 Click the **Options** tab.
- 3 Enable the **Automatically manage Windows devices** option.

The administrator can now check the state of the device and perform power operations, such as Power On, Power Off, Reboot, and Logoff.

Note: Devices running some older versions of Parallels Client cannot be managed and are marked as **Not Supported**.

Lock a Windows Device

To lock a Windows device that has an active session, select it in the list and then click the **Lock** item in the toolbar at the bottom. Note that the **Lock** icon is only enabled when the selected device is in the **Logged On** state.

You can also lock a device (or a device group) using the scheduler, which is described in the **Scheduling Windows Devices & Group Power Cycles** section (p. 191).

Shadow a Windows Device

By shadowing a Windows device, you gain full access to the Windows desktop on the device and can control local and remote applications.

To shadow a Windows device:

- 1 In the RAS Console, navigate to **Client Manager / Devices**.
- 2 Select a device and click the **Shadow** item in the toolbar at the bottom.

The Windows user will be prompted to allow the administrator to take control over the device and can choose to deny access. The **Request Authorization** prompt can be deactivated by the administrator. To do so:

- 1 In the Parallels RAS Console, select the **Client Manager** category and click the **Windows Device Groups** tab in the right pane.
- 2 Right-click a group and choose **Properties**.

- 3 In the **Windows Device Group** dialog, select the **Shadowing** tab and clear the **Request Authorization** option.

Desktop Replacement

The **Replace desktop** feature limits users from changing system settings or installing new applications. When this feature is enabled, Windows Desktop is replaced by Parallels Client, which converts it into a thin-client-like OS without actually replacing the operating system. This way the user can only deploy applications from Parallels Client, which gives the administrator a higher level of control over connected devices.

Additionally, the Kiosk mode allows you to limit the user from power cycling a device.

To enable the **Replace desktop** feature:

- 1 In the **Client Manager** category, select the **Windows Device Groups** tab page.
- 2 Right-click a group and choose **Properties**.
- 3 Click the **OS Settings** tab.
- 4 Enable the **Replace desktop** option and optionally the **Kiosk mode** option.
- 5 Click **OK**.

Note: This feature requires an administrative password set to switch between user and admin mode on the Windows device.

Switching to Admin Mode

In User Mode, the user is restricted to use only the applications provided by the administrator. In order to change system settings, switch the device to administration mode.

Change to Admin Mode by right-clicking on the system tray icon, selecting **Switch to admin mode** and providing the password configured.

The following table outlines features that are available in the Admin Mode and the User Mode.

Feature	User Mode	Admin Mode
Parallels Client Global Options		x
Parallels Client Farm Connection Properties		x
Configuration of Local Applications		x
Ability to add a New Parallels Remote Application Server		x

Connection		
Ability to add a New Standard RDP Connection		x
Ability to Manage Standard RDP Connections and Folders		x
Display Settings	x	x
Mouse Settings	x	x
Printer Settings		x
Task Manager		x
Control Panel		x
Command Prompt		x
Windows Explorer		x
Import / Export Settings		x

Configuring local applications when using Parallels Client desktop replacement

With the **Replace Desktop** option enabled, the administrator's goal should be to deploy remote applications or remote desktops and use the native OS to simply deploy the software needed to connect remotely. However, in some instances, local applications may be required. The administrator still has the ability to configure local applications to be shown within the Parallels Client Desktop Replacement, however it is necessary to switch to admin mode prior to it.

Publish a local application according to the following steps:

- 1 Shadow the user's session or use the user device station directly.
- 2 Switch the Parallels Client Desktop Replacement to admin mode.
- 3 Click **File > Add New Application**
- 4 Fill in the application information
- 5 Applications added will be visible in the Application Launcher.
- 6 Switch back to user mode once all the applications needed are configured.

Windows Desktop Replacement

This section explains what happens when the **Replace Desktop** option is enabled, and why it is useful to administrators.

When enabled, the Replace Desktop feature allows the administrator to convert a standard desktop into a limited device similar to a Thin Client, without replacing the operating system.

The end user will not have access to Windows Explorer, Taskbar or any other Windows components that usually allow them to install new applications or change system settings. The user can now only deploy applications configured within the Parallels Client, including remote applications, remote desktops, and locally configured applications. Local applications are allowed, so if a specific application is needed, but is not available remotely (e.g. a software which communicates with specific peripherals), the user can still deploy it.

When the **Replace Desktop** option is enabled, the following features take effect on the corresponding versions of Windows (7, 8, 8.1, 10):

Feature	XP	Vista	7	8	8.1	10
Replace Desktop with Parallels Client	x	x	x	x	x	x
Disable Start Button	x	x	x	x	x	x
Restrict Control Panel Access	x	x	x	x	x	x
Disable Windows Key	x	x	x	x	x	x
Disable the Task Manager	x	x	x	x	x	x
Disable Quick Access Toolbar	x	x	n/a	n/a	n/a	n/a
Disable Security Manager/Action Center Notifications	x	x	x	x	x	x
Lock the Taskbar	x	x	x	x	x	x
Remove Pinned Applications	n/a	n/a	x	x	x	x
Disable Metro Screen (user logs directly to desktop)	n/a	n/a	n/a	x	x	x
Disable Hot Corners	n/a	n/a	n/a	x	x	x
Disable Charm Hints	n/a	n/a	n/a	x	x	x
Disable Help Aids	n/a	n/a	n/a	x	x	x
Disable Windows Sidebar	n/a	x	x	n/a	n/a	n/a

In this mode, the user also has access to the Mouse and Display Control Panel applets. The user cannot change the Parallels Client Global Options and the Client Farm Connection Options. Advanced management features can be enabled if the device is switched into administration mode.

If the Windows Desktop Replacement feature is switched off, all the restrictions are removed and the standard desktop is made available to the user.

The following are the screenshots of a Windows 10 desktop before and after the **Replace Desktop** option is enabled.

Before

After

Scheduling Windows Devices & Groups Power Cycles

The **Scheduler** tab page of the **Client Manager** category can be used to schedule automatic power operations on devices.

Adding a New Scheduler Task

To schedule a task:

- 1 On the **Scheduler** tab page, click **Tasks > Add** to open the **Device Scheduler Properties** dialog.
- 2 Select the **Enable this scheduled entry** option.

- 3 Select an action in the **Action** drop-down list:
 - **Device Group Switch On**
 - **Device Group Log Off**
 - **Device Group Switch Off**
 - **Device Group Reboot**
 - **Device Group Lock**
- 4 Select a device group in the **Target** drop-down list.
- 5 Specify the task start date and time.
- 6 Select the **Repeat** option from the following choices:
 - **Never** (a task will run only once, as specified in the **Start** and **Time** fields)
 - **Every day**
 - **Every week**
 - **Every 2 weeks**
 - **Every month**
 - **Every year**
- 7 Enter a task description in the **Description** field.
- 8 Click **OK** to create the task.

Managing Scheduled Tasks

To modify an existing task, right-click it in the **Schedule List** and click **Properties** in the context menu.

To enable or disable an event, right-click it, click **Properties**, and then select or clear the **Enable this scheduled entry** option.

To execute a scheduled task immediately, right-click it and click **Execute Now** in the context menu.

To delete a task, right-click it and then click **Delete**.

Managing Client Policies

The **Policies** category allows you to manage Parallels Client policies for users on the network who connect to a server in the farm. By adding client policies, you can group users and push different Parallels Client settings to user devices.

All desktop clients (Windows, Linux, macOS) are supported. On iOS and Android devices, Connection Properties (p. 194) the Control Settings (p. 205) are supported.

Read this section to learn how to:

- Add a new client policy (p. 193)
- Configure connection properties (p. 194)
- Configure client policy options (p. 202)
- Configure control settings (p. 205)
- Configure gateway redirection (p. 206)

Add a New Client Policy

To add a new client policy:

- 1** On the **Policies** tab page, click the **Tasks** drop-down menu and then click **Add** (or click the **+** icon). The **Policy Properties** dialog opens.
- 2** The left pane contains a navigation tree allowing you to select a group of options to configure.
- 3** Make sure the **Policy** node is selected and then specify a policy name and an optional description.
- 4** In the **Browse Mode** drop-down list, select how you want to browse for users and groups. The preferred mode is **Secure Identifier** (default). Other options exist for backward compatibility.
- 5** In the **Tasks** drop-down menu, click **Add** (or click the plus sign icon).
- 6** In the **Select User and Groups** dialog, specify the target users and/or groups.

(optional) Configure criteria for the client policy

By default, a client policy applies to the configured users and groups in all situations. You can define a criteria so the policy only applies when the criteria is matched. This functionality allows you to create different policies for the same user, which will be applied depending on where the user is connecting from and from which device.

To create a new criteria:

- 1** In the **Policy Properties** dialog, select **Policy** in the left pane and then select the **Criteria** tab in the right pane.
- 2** In the **Gateway** section, select the criteria type in the first drop-down list and then specify the values (if applicable) in the second drop-down list.
- 3** In the **MAC Address** section, select the criteria type in the first drop-down list and then specify the values (if applicable) in the second drop-down list.

Configure Connection Properties

To configure connection properties, select the **Connection Properties** node in the left pane of the **Policy Properties** dialog. The right pane will display a number of tab pages where you can configure connection properties, including:

- Categories (p. 194)
- Connection (p. 194)
- Display (p. 195)
- Printing (p. 196)
- Scanning (p. 197)
- Local Resources (p. 198)
- Experience (p. 199)
- Network (p. 200)
- Authentication (p. 200)
- Advanced Settings (p. 201)

Categories

On the **Categories** tab page, select connection properties this policy will enforce. If a category is selected here, a user will not be able to change its settings in Parallels Client. If a category is left unchecked, the user will be able to change the corresponding settings.

Connection

The **Connection** tab page allows you specify connection properties and logon information.

Configuring the Primary Connection

The primary connection properties are grayed out because they always default to the primary RAS Secure Client Gateway. The only property that you can specify here is **Friendly Name**.

Configuring a Secondary Connection

If you have more than one RAS Secure Client Gateway, you can define a secondary connection, which will be used as a backup connection in case the primary gateway connection fails.

To add a secondary connection:

- 1 Click the **Secondary Connections** button.

- 2 In the **Secondary Connections** dialog, click the **Add** button and specify a server name or IP address. You can click the [...] button and select a server from the list. If none are available (or if the desired server is not in the list), type the server info in the field provided.
- 3 Select the connection mode and modify the port number if necessary. Click **OK**.
- 4 Back in the **Secondary Connections** dialog, if you have multiple secondary connections, you can move them up or down in the list. If the primary connection cannot be established, Parallels Client will use secondary connections in the order listed.
- 5 Click **OK**.

Configuring the Logon Information

In the **Logon** section, specify the following properties:

- 1 Select the **Auto Logon** option to enable Parallels Client to connect automatically without displaying the **Logon** dialog every time a user connects to a remote server.
- 2 In the **Authentication type** drop-down list, select the desired method of authentication:
 - **Single Sign-On**. This option will be included in the list only if the Single Sign-On module is installed during Parallels Client installation. Select this option to use local system credentials to connect to the remote server.
 - **Smart Card**. Select this option to authenticate using a smart card. When connecting to the remote server, a user will need to insert a smart card into the card reader and then enter a PIN when prompted.

Note: The allowed authentication type(s) must be specified in the RAS Console in **Connection / Authentication**.

Display

The **Display** tab page allows you to configure display options.

In the **General Options** section, specify the general display properties according to your preferences.

In the **Published Applications** section, select the **Use primary monitor only** option to start published applications on the primary monitor. Other monitors connected to a user's system will not be used.

Specify the **Desktop Options** as follows:

- **Smart-sizing**. Desktop smart sizing will scale a remote desktop to fit the connection window.
- **Embed desktop in launcher**. Enable this option to access a published desktop inside Parallels Client.

- **Span desktop across all monitors.** Enable this option to span published desktops across all connected monitors.
- **Display connection bar in full screen mode.** Enable this option to show the connection bar when connecting in full screen mode.

Printing

The **Printing** tab page allows you to configure printing options.

In the **Technology** drop-down list, select the technology to use when redirecting printers to a remote computer:

- **None.** No printer redirection will be used.
- **RAS Universal Printing technology.** Select this option if you want to use RAS Universal Printing technology.
- **Microsoft Basic Printing Redirection technology.** Select this option if you want to use Microsoft Basic printing technology.
- **RAS Universal Printing and Microsoft Basic redirection technologies.** Select this option to use both Parallels RAS and Microsoft technologies.

RAS Universal Printing

If you selected **RAS Universal Printing technology**, select printers to redirect in the **Redirect Printers** drop-down list:

- **All.** All printers on the client side will be redirected.
- **Default only.** Only the default printer will be redirected.
- **Specific only.** Select the printers to redirect from the provided list. The list becomes enabled only if you select this option.

In the **Choose Format** drop-down list, select a data format for printing:

- **Print Portable Document Format (PDF).** Adobe PDF. This option does NOT require you to install any local applications capable of printing a PDF document. All the necessary libraries are already installed together with Parallels Client.
- **View PDF with external application.** To use this option you must have a local application installed which is capable of viewing a PDF document. Note that not all applications are supported. For example, the built-in PDF viewer in Windows is not supported, so you must have Adobe Acrobat Reader (or a similar application) installed.
- **Print PDF with external application.** This option works similar to the View PDF option above. It also requires an application capable of printing a PDF document installed locally.
- **Enhanced Meta File (EMF).** Use vector format and embedded fonts.
- **Bitmap (BMP).** Bitmap images.

In the **Client Printer Preferences** section, select one of the following:

- **Use server preferences for all printers.** If this option is selected, a generic printer preferences dialog will be shown when a user clicks **Print** in a remote application. The dialog has only a minimal set of options that they can choose.
- **Use client preferences for all printers.** With this option selected, a local printer preferences dialog will open when a user clicks **Print** in an application. The dialog will contain a full set of options for a particular printer that the user has installed on their local computer. If they have more than one printer installed, a native preferences dialog will open for any particular printer that they choose to print to.
- **Use client preferences for the following printers.** This option works similar to the **Use client preferences for all printers option** (above), but allows users to select which printers should use it. If a printer is not selected, it will use the generic printer preferences dialog, similar to the first option in this list.

Default printer settings

To configure default printer settings, click the **Change Default Printer settings** button.

The default printer list shows printers that can be redirected by the client to the remote computer. The list also includes the printing technology that the available printers will use. The technology reflects the setting selected in the **Technology** section. For example, if the technology was set to **RAS Universal Printing technology**, only the printers using RAS Universal Printing will be listed.

To disable the default printer, select **<none>**. To redirect the default local printer on the client side to the remote computer, select **<defaultlocalprinter>**. When **<custom printer>** is selected, you can specify a custom printer which might be installed on the remote computer. The first printer that matches the printer name inserted in the custom text box, will be set as the default printer on the remote computer.

Select **Match exact printer name** to match the name exactly as inserted in the custom text box. Please note that the remote printer name may be different than the original printer name. Also note that local printers may not redirect due to server settings or policies.

You can specify the time a printer will be forced as default. If the default printer is changed during this time after the connection is established, the printer is reset as default.

Select the **Update the remote default printer if the local default printer is changed** option to change the remote default printer automatically when the local default printer is changed. Please note that the new printer must have been previously redirected.

Scanning

On the **Scanning** tab page, you can specify a scanner that should be used when one is required by a published application.

You can set the following options on the **Scanning** tab page:

- **Use.** Allows you to select a scanning technology. RAS Universal Scanning uses TWAIN and WIA redirection allowing an application to use either technology depending on the hardware type connected to the local computer. If you select **None**, scanning will be disabled.
- **Redirect Scanners.** Select scanners attached to your computer for redirection. You can select **All** (all attached scanners will be redirected) or **Specific only** (only the scanners you select in the provided list will be redirected).

Local Resources

Use the **Local Resources** tab page to configure how local resources are used in a remote session.

Remote Audio

Click the **Settings** button to configure remote audio playback and recording options.

Use the **Remote computer** drop-down list to select one of the following remote audio playback options:

- **Bring to this computer.** Audio from the remote computer will play on your local computer.
- **Do not play.** Audio from the remote computer will not play on your local computer and will be muted on the remote computer as well.
- **Leave at remote computer.** Audio will not play on your local computer but will play normally on the remote computer.

Use the **Quality** drop-down list to adjust the audio quality:

- **Dynamically adjust based on available bandwidth.** This option will increase or decrease the audio quality based on your connection speed. The faster the connection, the higher audio quality setting will be used.
- **Always use medium audio quality.** The audio quality is fixed at the medium level. You can use this option when you don't require the best possible audio quality and would rather use the available bandwidth for graphics.
- **Always use uncompressed audio quality.** The audio quality is fixed at the highest level. Select this option if you have a very fast connection and require the best possible audio quality.

The **Recording (if applicable)** option allows you to enable audio recording on the remote computer. For example, you can speak into a microphone on the local computer and use a sound recording application on the remote computer to record yourself.

Keyboard

Select how you want to apply key combinations (e.g. Alt+Tab) that you press on the keyboard:

- **On the local computer.** Key combinations will be applied to Windows running on the local computer.

- **On the remote computer.** Key combinations will be applied to Windows running on the remote computer.
- **In full screen mode only.** Key combinations will be applied to the remote computer only when in the full-screen mode.

Local Devices and Resources

Choose local disk drives, devices, and other resources that you want to redirect to a remote computer. Redirecting a resource makes it available for use in a remote session. For example, a redirected local disk drive will be available in a remote application, so you can read from and write to it.

The following options are available:

- **Clipboard.** Select this option to enable the local clipboard in a remote session.

Note: When you clear this option, it will also disable the Remote Clipboard functionality for given users in Parallels HTML5 Client. For more information, please see **Using the Remote Clipboard** (p. 147).

- **Disk drives.** Select this option and then click **Configure Drives**. In the dialog that opens, select local drives you want to redirect. If you select the **Use also disk drives that I plug in later** option, disk drives that you connect to your local machine later will be automatically available in a remote session.
- **Devices.** Select this option and then click **Configure Devices**. Devices that are currently connected to your local computer will appear in the list. This includes supported Plug and Play devices, media players based on the Media Transfer Protocol (MTP), and digital cameras based on the Picture Transfer Protocol (PTP). If a device is connected to your computer but does not appear in the list, it means it is not a supported Plug and Play device. Please note that disk drives and smart cards are excluded from this list (you redirect them using dedicated **Disk drives** and **Smart cards** options). The **Show previously connected devices** option displays devices that are not currently connected but were connected previously.
- **Serial ports.** Select this option to redirect serial ports.
- **Smart cards.** Select this option to redirect smart cards.
- **Allow file transfer command.** Enables or disables the remote file transfer functionality. For more information, see **Enabling or Disabling Remote File Transfer** (p. 206).

The **Click this link to configure printers** option opens the **Printing** tab page where you can configure printer redirection.

Experience

The **Experience** tab page allows you to tweak the connection speed to optimize the performance of the connection with the remote server. If you are connecting to a remote server on a local network that runs at 100 Mbps or higher, it is usually safe to have all of the experience options turned on.

It is also recommended to enable compression to have a more efficient connection. The following compression options are available.

Enable Compression: Enables compression for RDP connections.

Universal printing compression policy: The compression type should be selected based on your environment specifics. You can choose from the following options:

- **Compression disabled.** No compression is used.
- **Best speed (uses less CPU).** Compression is optimized for best speed.
- **Best size (uses less network traffic).** Compression is optimized to save network traffic.
- **Based on connection speed.** The faster the connection speed, the lower compression level and the minimum data size to compress are used.

Universal scanning compression policy: This drop-down list has the same options as the universal printing compression above. Select the compression type based on your environment specifics.

Network

Use the **Network** tab page to configure a proxy server if you have one.

Select the **Use proxy server** option and then select the protocol from the following list:

- **SOCKS4.** Enable this option to transparently use the service of a network firewall.
- **SOCKS4A.** Enable this option to allow a client that cannot connect to resolve the destination host's name to specify it.
- **SOCKS5.** Enable this option to be able to connect using authentication.
- **HTTP 1.1.** Enable this option to connect using a standard HTTP 1.1 protocol connection.

Specify the proxy host domain name or IP address and the port number.

For SOCKS5 and HTTP 1.1 protocols, select **Proxy requires authentication** and enter user credentials.

Authentication

Use the **Authentication** tab page to specify what should happen if authentication of an RD Session Host, Remote PC, or Guest VM fails.

In the **If authentication fails** drop-down list, select one of the following options:

- **Connect.** The user can ignore the certificate of the server and still connect.
- **Warn.** The user is alerted about the certificate and still has the ability to choose whether to connect or not.

- **Do not connect.** The user is not allowed to connect.

Advanced Settings

The Advanced **Settings** tab page allows you to customize the default behavior of Parallels Client.

You can specify the following properties:

- **Use client system colors.** Enable this option to use the client system colors instead of those specified on the remote desktop.
- **Use client system settings.** Enable this option to use the client system settings instead of those specified on the RD Session Host.
- **Create shortcuts configured on server.** For each published application, the administrator can configure shortcuts that can be created on the client's desktop and the Start menu. Select this option to create the shortcuts, or clear the option if you don't want to create them.
- **Register file extensions associated from the server.** For each published application, the administrator can create file extension associations. Use this option to either register the associated file extensions or not.
- **Redirect URLs to this computer.** Enable this option to use the local web browser when opening 'http:' links.
- **Redirect Mail to this computer.** Enable this option to use the local mail client when opening 'mailto:' links.
- **Always ask for credentials when starting applications.** If this option is enabled, the user will be prompted to enter their credentials when starting applications.
- **Allow Server to send commands to be executed by client.** Enable this option to allow commands being received from the server to be executed by the client.
- **Confirm Server commands before executing them.** If this option is enabled, a message is displayed on the client to confirm any commands before they are executed from the server.
- **Network Level Authentication.** Check this option to enable network level authentication, which will require the client to authenticate before connecting to the server.
- **Redirect POS devices.** Enables the Point of Service (POS) devices such as bar code scanners or magnetic readers that are attached to the local computer to be used in the remote connection.
- **Use Pre Windows 2000 login format.** If this option is selected, it allows you to use legacy (pre-Windows 2000) login format.
- **Disable RDP-UDP for gateway connections.** Disables RDP UDP data tunneling on the client side. You can use this option when some clients experience random disconnects when RDP UDP data tunneling is enabled on the RAS Secure Client Gateway (the **Network** tab page in the gateway **Properties** dialog), while other clients are not.

Connection Advanced Settings

Click the **Connection Advanced Settings** button to configure the following settings:

- **Connection Timeout.** This is the amount of time the client will try to connect to the Parallels Remote Application Server until the connection is aborted. While the connection is being established, the connection banner will be shown.
- **Show Connection Banner if connection is not established within.** Specifies the time period in seconds after which the connection banner will be displayed.
- **Show Desktop if published application does not start within.** If a published application is not launched within the time period specified in this field, the server's desktop will be loaded. This is helpful if an error occurs on the server while launching an application. By loading the server's desktop, the error can be seen.
- **Reconnect if connection is dropped.** Select this option and set the number of **Connection Retries**. If a connection is dropped, the Parallels Client will automatically try to reconnect.
- **Override computer name.** Specifies the name that your computer will use during a remote desktop session. If set, this will override the default computer name. Any filtering set by the administrator on the server side will make use of the **Override computer name**.

Configure Client Policy Options

To configure connection options, select the **Options** node in the left pane. Use the tab pages in the right pane to set the options.

General

On the **General** tab page, specify the following options:

- **Connection Banner.** Select a banner to display while establishing a connection.
- **Automatically refresh connected RAS connections every [] minutes.** Select this option and specify the time interval to automatically refresh a connection. This will refresh the published resources list in Parallels Client.
- **Check for updates on startup.** [Parallels Client for Windows only] Select this option and specify an update URL if you want Parallels Client for Windows to check for updates when it starts. The URL can point to the Parallels website or you can store updates on your local network and use this local URL. For the information on how to configure a local update server, please read <http://kb.parallels.com/123658>.

Note: Parallels Client for Mac can be updated only from the App Store. Parallels Client for Linux does not support this feature.

Single Sign-On

Parallels Client for Windows comes with its own SSO component that you can install and use to sign in to Parallels RAS. However, if you already use a third-party credential provider component on your Windows computers, you need to configure Parallels RAS and Parallels Client to use the Parallels RAS SSO component to function as a wrapper for the third-party credential provider component.

Note: In order to use a third-party component, you must still install Parallels SSO component on Windows computers. After you complete the configuration steps described below, the Parallels SSO component will be used by Parallels Client as a wrapper over the credentials provider component that you use.

To specify a third-party component, select the **Force to wrap third party credential provider component** option and specify the component's GUID in the field provided. You can obtain the GUID in Parallels Client as follows:

- 1 Install Parallels Client on a computer that has the third-party component installed.
- 2 In Parallels Client, navigating to **Tools > Options > Single Sign-On** (tab page).
- 3 Select the "Force to wrap..." option and then select your provider in the drop-down list.
- 4 Click the **Copy GUID to Clipboard** button to obtain the component's GUID.

You will also need to specify the component's GUID when setting up an invitation email in the RAS Console. If you haven't set up an invitation email yet, you can do it as follows:

- 1 In the RAS Console, select the **Start** category and then click the **Invite Users** item in the right pane.
- 2 On the second page of the wizard (target platform and connection options), click the **Advanced** button.
- 3 In the dialog that opens, select the **Force to wrap third party SSO component** option and specify the GUID of the component.

For more information, see the **Invite Users** section (p. 26).

After the policies are applied on Windows computers, Parallels Client will be automatically configured to use the specified third-party credentials provider.

Advanced Settings

On the **Advanced Settings** tab page:

- Specify a language that Parallels Client should use. The **Default** language option specifies to use the main language used by the client's operating system.
- The list box contains advanced Parallels Client properties that you can set according to your preferences. The properties are described below.

Advanced Parallels Client properties:

- **Hide Launcher when application is launched.** If this option is enabled, the launcher will be minimized in the system tray after an application is launched.
- **Always on Top.** With this feature enabled, other applications will no longer mask the launcher.
- **Do not warn if server certificate is not verified.** When connected to a RAS Secure Client Gateway over SSL, and the certificate is not verified, a warning message will be displayed. You can disable this warning message by enabling this option.
- **Show folders page.** Enabling this option will show the available folders while showing the hierarchy of the application groups as configured on the server.
- **Minimize to tray on close or escape.** Enable this feature to place the Parallels Client into the System Tray when you click on the **Close** button or hit escape.
- **Launch automatically at Windows startup.** This option will place a shortcut in the start menu folder of the client and the Parallels Client will launch automatically on Windows startup.
- **Add RAS Connection automatically when starting web or shortcuts items.** This option will add the connection preferences in the Parallels Client when starting an item contained in a connection that is not yet listed.
- **Don't show prompt message for auto add RAS Connections.** Enable this option to disable prompt messages when adding auto connections.
- **Clear session cookies on exit.** When a user logs on, a Parallels Remote Application Server logon cookie is kept on the client side. This will allow the user to connect again with Remote Application Server without re-authenticating. Check this option to delete any cookies when the user closes the Parallels Client.
- **Close error messages automatically.** When a session disconnects because of an error, the error is automatically dismissed after 15 seconds.
- **Automatic fonts installed** (administrators only). If automatic fonts are installed on the server, they will be available when a session connects.
- **Swap Mouse Buttons.** When enabling this setting, the mouse buttons will be swapped on the remote computer.
- **Redirect vendor paper sizes for RAS Universal Printing.** When enabling this setting, non-standard paper sizes which are not included in the standard options will be redirected to the client. Sizes may vary depending on the vendor.
- **Raw printing support.** When enabling this setting, printing will still work for applications sending data in RAW format.
- **Convert non distributable fonts data to images.** During RAS Universal Printing, if a document includes non-distributable fonts, each page is converted to an image.
- **Cache printers hardware information.** Caching of printer hardware information locally to speed-up RAS universal printer redirection.
- **Cache RAS Universal Printing embedded fonts.** Caching of embedded fonts locally to speed-up RAS universal printing process time.

- **DPI aware.** This will force a published application to be DPI-aware depending on the client's DPI settings. This feature works on Windows 8.1 or higher.
- **Refresh printer hardware information every 30 days.** Forces the printer hardware information cache update even if nothing has changed in 30 days. When this option is off, the cache will only be refreshed if there were known changes.

Configure Control Settings

Control Settings options allow you to control various actions on the client side. These options affect the following Parallels Clients:

- Windows
- Linux
- Mac
- Android
- iOS
- Windows Phone

To configure control settings:

- 1 Select the **Control Settings** node in the left pane.
- 2 On the **Connections** tab page, select (or clear) the following options:
 - **Do NOT add RAS connections.** When a user presses the **Add Connection** button, an RDP connection is immediately created.
 - **Do NOT add Standard RDP connections.** When a user presses the **Add Connection** button, a RAS connection is immediately created
- 3 On the **Password** tab page, specify the following options:
 - **Do NOT save password.** Option to save the password will not be shown to the user for that particular connection. Password is never saved on a disk, but kept in memory until the user closes the application.
 - **Do NOT change password.** Option to change the password will not be shown in the context menu for that particular connection.
- 4 On the **Import and Export** tab page:
 - **Do NOT import/export setting.** The **Import** and **Export** buttons will not be shown to the user.

When done configuring client policies, click **OK** to save the changes and close the **Policy Properties** dialog.

To modify an existing client policy, right-click it and select **Properties** in the context menu.

Configure Gateway Redirection

Redirection options allow you to move your existing users from one RAS Secure Client Gateway to another Gateway within the same farm, or you can even redirect users to a Gateway in a different farm.

To configure redirection options:

- 1** Select the **Redirection** node in the left pane of the **Policy Properties** dialog.
- 2** In the right pane, specify the new connection properties, including:
 - Gateway address
 - Connection mode
 - Port number
 - Alternative address

When you apply this policy to user devices, the following will happen:

- Parallels Client connection settings are automatically updated on each affected device.
- Parallels Client tests the new connection. If succeeded, the current connection policies are removed and new policies are added.
- If Parallels Client cannot connect to Parallels RAS using new settings, the application list will not be shown and an error message will be displayed saying that the redirection policy has failed to apply. The user will be advised to contact the system administrator.

Note: You can use policy criteria to configure multiple policies for internal vs. external users. To specify policy criteria, select the **Policy** node in the left pane of the **Policy Properties** dialog and then select the **Criteria** tab page.

Enabling or Disabling Remote File Transfer

Parallels RAS provides end users with the ability to transfer files remotely to and from a remote server.

Note: At the time of this writing, file transfer is supported in Parallels HTML5 Client and Parallels Client for Chrome only.

As a Parallels RAS administrator, you have the ability to enable or disable file transfer capabilities if you believe that it presents a security risk. To make this functionality as flexible as possible, Parallels RAS allows you to enable/disable file transfer on the following three levels:

- RD Session Host server, VDI Host, or Remote PC
- Parallels HTML5 gateway

- Client policy

Whatever file transfer settings you configure on each level, they take precedence in the order listed above. For example, if you enable it on a Parallels HTML5 gateway but disable it on an RD Session Host server, file transfer will be disabled for all users who connect to the given RD Session Host server through the given HTML5 gateway. As another example, you can enable file transfer on an RD Session Host server and then disable it for a particular Client policy (or an HTML5 gateway). This way you can control which clients can use file transfer and which cannot.

Read the subsequent sections to learn how to enable or disable file transfer on each level.

Server Level

To enable or disable remote file transfer capabilities on an RD Session Host server, VDI Host, or Remote PC, do the following:

- 1 In the Parallels RAS Console, select the **Farm** category and then select a desired server type (RD Session Host, VDI Host, Remote PCs) in the middle pane.
- 2 Right-click a desired server in the right pane and choose **Properties**.
- 3 Select the **Agent Settings** tab page.
- 4 Select or clear the **Allow file transfer command** option (at the bottom). If the server is using default settings, click the **Edit Defaults** link in the top-right corner and then select or clear the same option in the **Default Server Properties** dialog.

HTML5 Gateway Level

To enable or disable remote file transfer capabilities on an HTML5 gateway, do the following:

- 1 In the Parallels RAS Console, navigate to **Farm / Site / Gateways**.
- 2 Right-click a desired RAS Secure Client Gateway in the right pane and choose **Properties**.
- 3 Select the HTML5 tab page and select or clear the **Allow file transfer command** option (at the bottom).

Client Policy Level

To enable or disable remote file transfer capabilities on a Client policy, do the following:

- 1 In the RAS Console, select the **Policies** category.
- 2 Right-click a desired policy in the right pane and choose **Properties**.
- 3 Select the **Connection Properties** item in the left pane.
- 4 Select the **Local Resources** tab page in the right pane.
- 5 Select or clear the **Allow file transfer command** (at the bottom).

Parallels RAS Reporting Service

Parallels RAS Reporting Service is an optional component that allows Parallels RAS administrator to run and view predefined Parallels RAS reports. Reports include user and group activity, device information, session information, and application usage. Read this chapter to learn how to install Parallels RAS Reporting Service and how to use it.

In This Chapter

Installing Parallels RAS Reporting Service	208
Viewing Reports	211

Installing Parallels RAS Reporting Service

To use Parallels RAS Reporting Service, you need to install and configure Microsoft SQL Server and the RAS Reporting Service itself. This section contains installation requirements, followed by RAS Reporting Service installation instructions.

Operating System Requirements

The RAS Reporting service must be installed on a server running one of the following Windows Server versions:

- Windows Server 2008
- Windows Server 2008 R2
- Windows Server 2012
- Windows Server 2012 R2
- Windows Server 2016

User Account Requirements

To view RAS reports, a default AD user account will be created by the RAS Reporting Service installer. The account name is **RASREPORTINGVIEW**. You can specify a different user during the RAS Reporting Service setup if you wish.

Microsoft SQL Server Requirements

The following Microsoft SQL Server versions are supported:

- Microsoft SQL Server 2008 SP1
- Microsoft SQL Server 2008 R2 SP1
- Microsoft SQL Server 2012
- Microsoft SQL Server 2014
- Microsoft SQL Server 2016

The Microsoft SQL Server instance must have the following features installed:

- Database Engine Services
- Reporting Services - Native
- Management Tools

The SQL Server instance must be configured as follows:

- Must be a named instance. The default instance name and instance ID used by Parallels RAS Reporting is RASREPORTING. You can specify a different name, but you have to make sure that you use the same name when configuring the RAS Reporting Service (as described later in this section).
- The SQL Server administrators must include System Administrator, AD Administrator, System User.

SQL Server Reporting Services must be configured as follows:

- Report Server Web Service virtual directory must be set to ReportServer_RASREPORTING.
- Report Server Web Service TCP port must be set to 8085.
- Report Manager TCP port must be set to 8085.

Note: For installations running on a multi-server farm environment, it is recommended that Microsoft SQL Server is installed on a dedicated server.

Installing the RAS Reporting Service

To install the RAS Reporting Service:

- 1 Log in to the server running Microsoft SQL Server with an account that has administrative privileges (AD).
- 2 Download the latest version of the Parallels Remote Application Server Reporting Service from <https://www.parallels.com/products/ras/download/links/>
- 3 Once downloaded, double-click the **RASReporting-xxx.msi** file to run the installation wizard.

- 4 Click **Next** when prompted.
- 5 Review and approve the end-user license agreement and click **Next**.
- 6 Specify the target folder for the installation and click **Next**.
- 7 Specify the SQL Server instance name. The default instance name is RASREPORTING. If you would like to use a different instance, you can specify it on this page. If the instance doesn't exist, you need to create it first.
- 8 Specify the user account that will be used to view reports. The default user is RASREPORTINGVIEW. If you would like to use a different user, you can specify it on this page. If the user doesn't exist, you need to create it first.
- 9 Click **Install**.
- 10 When the installation is complete, click **Finish**.

Configuring RAS Reporting Service in the RAS Console

To configure the RAS Reporting Service:

- 1 Select the **Administration** category in the RAS Console and then click the **Reporting** tab in the right pane.
- 2 On the **Reporting** tab page, specify the following options:
 - **Enable RAS Reporting:** Select this option to enable the RAS reporting functionality.
 - **Server:** Specify the FQDN or IP address of the server hosting your SQL Server database where the Reporting service is installed.
 - **Port:** The port specified here is used by the service which receives data from the RAS Publishing Agent. The default port is 30008.
 - **Prompt user for login details.** Will prompt the user for AD credentials when generating reports.
 - **Use following credentials.** Specify AD username and password to be used each time a report is generated. The default user name is RASREPORTINGVIEW. If you specified a different user when you installed the RAS Reporting module, you can use it here.
- 3 When done, click the **Test connection** button to test the configuration.

Advanced Settings

Advanced settings allow the administrator to fine-tune the data collected by the reporting service and define for how long this data is retained before purged.

In the RAS Console, navigate to **Administration / Reporting**. On the **Reporting** tab page, click the **Tracking Settings** button. The **Advanced Setting** dialog opens.

In the **Session Information** section, configure the following options:

- **Enable Tracking.** Records sessions data (affects all reports except Server Reports).

- **Retain information for.** Specify the period session information is retained for before purged.

In the **Server Counters** Information section, configure the following:

- **Enable Tracking.** Records server counter data (affects Server Reports only).
- **Retain information for.** Specify the period server counters information is retained for before purged.
- **Track CPU / Memory counter when change is more than.** Set the minimum CPU/Memory resource usage required to record data.

Viewing Reports

The RAS Reporting Service includes 14 predefined reports in 5 groups:

- 1 User Reports.** This group provides insight into how end users are interacting with Parallels RAS and includes the following reports:
 - User activity - shows all sessions produced by all users in the system. Report includes information about each session; active time, idle time and disconnected time.
 - User session activity - shows all sessions produced by a single user. Report includes information about each session; active time, idle time and disconnected time.
 - Devices used by user - shows information about the devices being used by a user. Report includes information such as; device vendor, device model and total time used.
 - Client operating system used by user - shows the operating system being used by a particular user; operating system, total time used.
- 2 Group Reports.** These reports provide information about how groups of users are interacting with Parallels RAS and includes the following reports:
 - Groups activity - shows all sessions produced by all groups in the system. Report includes information such as; active, idle and disconnected time.
 - Group sessions activity - shows all sessions produced by a group in the system. Report includes information about each session produced by each user in the group such as; start, end, active, idle, disconnect and total time.
 - Devices used by group - shows information about the devices being used by users that are members of a particular group. Report includes information such as; device vendor, model and total time used.
 - Client operating system used by the group - shows the operating system being used by members of a particular group; operating system and total time used.
- 3 Devices Reports.** This group provides information about the devices that are connecting to Parallels RAS and includes the following reports:
 - Devices used - shows all devices using the system. Report includes information such as; manufacturer, model and the number of sessions opened by the device.

- Client operating system used - shows devices and corresponding operating systems that are using the system. Report includes information such as; device model, operating system and amount of devices.
- RDP version used - shows the Parallels Client version , the device using that version and how many of those devices are being used.

4 Server Reports. This group provides information about activity about the Parallels RAS server components and includes the following reports:

- Sessions activity on server - shows the session activity of users on a particular server. Report includes information such as; start, end, active, idle and disconnect time.
- Server health by server - shows server CPU and RAM usage for a particular server in a graph.

5 Application Reports. This group provides information about the applications used with Parallels RAS and includes the following report:

- Applications usage - shows information about the applications used in the system. Report includes information such as; application name, number of times used and the total time the application was used for.

Note: The first time the reports are viewed, you may be requested to add <http://<server domain/ IP>> as a trusted website. This will appear depending on the Parallels RAS machine's "Internet Explorer Enhanced Security Configuration".

To use RAS Reporting, select the **Reporting** category in the RAS Console.

The reporting interface consists of useful tools which are split into sections as described below:

- 1** Remove group nodes and refresh the list of reports available below.
- 2** Reports generated are retained as tabs shown in this section. Click a tab to review the report generated and even cancel a tab to close a report.
- 3** The blue button expands the reporting interface into full screen, while the **Tasks** drop-down menu allows you to apply the following actions to reports: **Duplicate**, **Full screen**, **Close report**, **Close other reports**, **Close reports on the right**, and **Close all reports**.
- 4** This section lists the arguments available to apply constraints to reports such as the time frame the report will cover and chart type. These change depending on the report selected.
- 5** The **View Report** button applies the constraints set in the section 4 to generate the report.
- 6** Click this arrow to collapse sections 4 and 5.
- 7** From this section, refresh the report, print the report, export the report to a data feed, or save the report in any of the following formats; XML, CSV, PDF MHTML, TIFF and Word.
- 8** Click this arrow to collapse the reports listing.
- 9** This section displays the new report dialog or old report selected in section 2.

Note: Parallels RAS reporting requires MS SQL Server and the Reporting Service installed and configured.

Parallels RAS Performance Monitor

Parallels RAS Performance Monitor is a browser-based dashboard designed to help administrators analyze a Parallels RAS deployment bottlenecks and resource usage. The dashboard provides a visual display of performance metrics, which can be viewed in the Parallels RAS Console or in a web browser.

In This Chapter

Overview	214
Installing Parallels RAS Performance Monitor	215
Using Parallels RAS Performance Monitor	215

Overview

Components

Parallels RAS Performance Monitor consists of the following components:

- **InfluxDB database** — a database for storage of system performance data.
- **Grafana dashboard** — a browser-based dashboard providing a visual display of performance metrics.
- **Telegraf service** — a service that collects performance data on a server where it is installed. The service is installed automatically when you add a server to a Parallels RAS farm and install a corresponding RAS Agent on it (e.g. RAS Secure Client Gateway Agent, RD Session Host Agent, Remote PC Agent, etc.).

How it works

The Telegraf service is stopped by default, so it doesn't collect any data. To start the service on each server in the farm, the performance monitoring functionality must be configured and enabled in the Parallels RAS Console. Once enabled, the Telegraf service begins collecting a predefined set of performance counters at a fixed time interval (10 seconds). It then sends the collected data to the InfluxDB database for storage. To view performance metrics, the Parallels RAS administrator uses the dashboard (Grafana), which displays the visual representation of performance counters in real time.

The performance metrics are grouped in the dashboard by type (Session, CPU, Memory, Disk, etc.), so the administrator can view each group of metrics separately. The administrator can also select whether to view performance metrics for one or more specific servers or for all servers in the farm or site. In addition, the administrator can select a specific site for which the data should be displayed.

Installing Parallels RAS Performance Monitor

Requirements

Parallels RAS Performance Monitor can be installed on a dedicated server or on a server hosting any of the Parallels RAS components. The installation comes down to installing the InfluxDB database and the Grafana dashboard service, which is done automatically using the installation wizard as described in the **Installation** subsection below.

The server on which you'll be installing Parallels RAS Performance Monitor must have the following communication ports open:

- TCP port 8086 (used by the InfluxDB database).
- TCP port 3000 (used by the Grafana performance dashboard).

Installation

To install Parallels RAS Performance Monitor:

- 1** Download the Parallels RAS Performance Monitor installer from <https://www.parallels.com/products/ras/download/links/>
- 2** Run the installation wizard (the RASPerformanceMonitor.msi file) and follow the onscreen instructions.
- 3** Close the wizard when finished.

The next step is to configure access to Parallels RAS Performance Monitor in the RAS Console.

Using Parallels RAS Performance Monitor

Configure access to Parallels RAS Performance Monitor

To enable data collection and view the dashboard:

- 1** In the RAS Console, navigate to **Administration > Reporting**.
- 2** Select the **Enable RAS Performance Dashboard** option (the lower section of the tab page).

- 3** Enter the FQDN or IP address of the server where you have the InfluxDB database and Grafana dashboard installed.
- 4** Click **Apply** to commit the changes.

Once you perform the steps above, the Telegraf service is started on each server in the site and the data collection begins.

Open the dashboard

Note: You should give Parallels RAS Performance Monitor some time to collect performance data before you can view it (about 1 hour on initial installation).

To view the dashboard, do the following:

- 1** In the RAS Console, select the **Monitoring** category.
- 2** The dashboard is displayed in the right pane of the console. The logon to the dashboard is performed automatically, so no logon credentials are required.

The buttons on the **Performance Monitoring Dashboard** tab page (below the dashboard area) are as follows:

- **Home.** Displays the **Home Dashboard** page. The button is useful when you click on an external link in the dashboard, which may take you to an external web page.
- **Refresh.** Reloads the current page.
- **Open in browser.** Opens the performance dashboard in a web browser.

When you open the dashboard for the first time, the **Home Dashboard** page is displayed.

To view performance metrics, click the **Home** drop-down menu at the top of the dashboard and then click **RAS Infrastructure Health**.

This will open the page displaying performance metrics (please note that the other menu item, RAS Infrastructure Health Report, is for internal use only and should be ignored).

The menu bar on the **RAS Infrastructure Health** page includes the following items:

- **Hosts.** Allows you to select one or multiple servers for which the performance metrics should be displayed. To display the data for all servers in the site, select **All**. Please note that if you don't see any servers in the list, you need to wait for Parallels RAS Performance Monitor to collect the initial set of statistics. This only happens on initial installation.
- **Site.** Allows you to select a site for which to display the data. Selecting **All** displays the data for all sites in the farm.
- **Instance.** This item allows you to select a specific counter instance (if there's more than one). For Network counters it is usually the name of a network interface. For Disk counters it is a disk name. Other types of counters don't usually have multiple instances.

To view metrics of a specific type, expand the desired category in the main area of the dashboard. The categories include:

- **Session Information.** Displays the information about active sessions (act_sess) and disconnected sessions (disc_sess).
- **CPU usage.** CPU counters.
- **Free memory.** Physical memory counters.
- **Disk usage.** Disk I/O counters.

- **Network usage.** Network interface I/O counters.
- **System information.** System information counters.

Performance metrics are displayed in the dashboard as a graph. Different counters are displayed using different colors. The legend is displayed below the graph.

To zoom in on a particular area of a graph, select a rectangular block with a mouse. You can also use the **Zoom** controls at the top of the dashboard for time range zoom out, shift time forward, or shift time backwards.

To select a specific time range, click the "clock icon" item at the top and then specify a time range or select one from the **Quick ranges** list.

To go the **Home Dashboard** page, click the **Home** drop-down menu and choose **Home**. If you are viewing the dashboard in the Parallels RAS Console, you can also click the **Home** button in the console itself.

For more information about performance metrics and their meaning, please refer to the following articles from Microsoft:

- <https://technet.microsoft.com/en-us/library/cc976785.aspx>
- <https://technet.microsoft.com/en-us/library/2008.08.pulse.aspx>

Connection and Authentication Settings

A Parallels RAS administrator has the ability to customize how users connect to Parallels RAS. This chapter describes connection and authentication settings that can be configured according to your organization requirements. It then explains how to use second level authentication for even higher level of security.

In This Chapter

RAS Publishing Agent Connection Settings	220
Remote Session Settings	221
Restricting Access by Parallels Client Type and Build Number	222
Second Level Authentication	222

RAS Publishing Agent Connection Settings

RAS Publishing Agent connection settings can be accessed from the **Connection** category.

Choosing Authentication Type

Select the **Authentication** tab page. In the **Authentication Type** drop-down list, select one of the following options:

- **Username/Password.** The user credentials are validated by the Windows system on which RAS is running. The credentials used for Windows authentication are also used to log into an RDP session.
- **Smart Card.** Uses smart card authentication. Similar to Windows authentication, smart card credentials can be shared between both RAS and RDP. Hence, smart card credentials only need to be entered once. Unlike Windows authentication, the user only needs to know the smart card's PIN. The username is obtained automatically from the smart card, so the user doesn't need to provide it.
- **Username/Password or Smart Card.** Uses both Windows and smart card authentication.

Note that if smart card authentication is disabled, RAS Publishing Agent will not hook the Local Security Authority Subsystem Service (LSASS).

Smart card support is available on Windows Server 2008, 2008 R2, 2012, 2012 R2.

Smart card authentication can be used in Parallels Client for Windows and Parallels Client for Linux.

Enforcing Authentication

By default, all users are required to authenticate the connection against Parallels Remote Application Server before even viewing the list of the available published applications or desktops. By disabling the option **Always require user credentials for application list** on the **Authentication** tab page you can allow users to see the list of published resources without being authenticated. As a result, the user will be able to see the list, but as soon as the user tries to open an application or a desktop, the server will ask to supply credentials.

Configuring Authentication

Once authentication is enforced, you can configure the Parallels Remote Application Server to authenticate users against a specific domain by entering the domain name in the **Domain** input field.

- **All Trusted Domains.** If the information about users connecting to Parallels Remote Application Server is stored in different domains within a forest, select the **All Trusted Domains** option to authenticate against multiple domains.
- **Use client domain if specified.** If this option is cleared, the domain name specified by the administrator will be automatically populated in Parallels Client.
- **Force clients to use NetBIOS credentials.** If this option is selected, the Parallels Client will replace the username with the NetBIOS username.

Note: If a certificate on your smart card does not contain a user principal name (UPN) in the "Subject Alternative Name" (SAN) field (or if it doesn't have the "Subject Alternative Name" field at all) you have to disable the **Force clients to use NETBIOS credentials** option.

Recommendation: After changing the domain names or some other authentication related changes, click the **Clear cached session IDs** button on the **Settings** tab page.

Authenticating Against Non Domain Users

In order to authenticate users sessions against users specified on a standalone machine you must enter the [workgroup_name] / [machine_name] instead of the domain name. For example if you would like to authenticate users against a list of local users on a machine called SERVER1 that is a member of the workgroup WORKGROUP, enter the following in the domain field: WORKGROUP/SERVER1.

Remote Session Settings

The **Settings** tab page in the **Connection** category allows you to configure the following remote session options:

- **Declare session idle after.** This option affects reporting statistics, whereby a session is declared idle after the amount of time specified without any activity.

- **Automatically logoff RAS idle session after.** Specifies the time period after which an idle session (a user RAS connection) should be logged off. Once the session is logged off, the user is disconnected from Parallels RAS and is presented with the **Connections** dialog in Parallels Client as a way to notify them that they were logged off. They can use the dialog to log back on if desired.
- **Cached Session Timeout.** Specify the amount of time that a session is cached for (higher amount of time reduces AD transactions).
- **Clear cached session IDs.** Clears all cached session information.

Restricting Access by Parallels Client Type and Build Number

You can specify a minimum requirement for the Parallels Client type and version number in order for it to connect to the Parallels RAS farm or to list published resources.

To specify Parallels Client requirements:

- 1 In the RAS Console, select the **Connection** category and click the **Allowed Devices** tab.
- 2 In the **Mode** drop-down list, select from the following options:
 - **Allow all clients to connect to the system.** No restrictions. All Parallels Client types and versions are allowed full access.
 - **Allow only the selected clients to connect to the system.** Allows you to specify Parallels Client types and versions that are allowed to connect to the Parallels RAS farm. Select the desired Parallels Client types in the **Clients** list. To set the **Minimum build** value, right-click the client type and choose **Edit**. Type the version number directly in the **Minimum build** column.
 - **Allow only the selected clients to list the published items.** Allows you to specify Parallels Client types and versions that can list published resources. Compared to the option above, this one does not restrict Parallels Clients connecting to Parallels RAS. Select this option and then select the desired Parallels Client types in the **Clients** list. To set the **Minimum build** value, right-click the client type and then click **Edit** in the context menu. Type the version number directly in the **Minimum build** column.

If a restriction is configured and a Parallels Client is excluded from the list, the user running it will receive a corresponding error message and will be advised to contact the system administrator.

Second Level Authentication

Parallels RAS allows you to use two-factor authentication for access control by configuring a second level authentication.

When second level authentication is used, users will have to authenticate through two successive stages to get the application list. While the first level authentication will always use native authentication (Active Directory / LDAP), the second level can use one of the following:

- RADIUS (p. 223)
- SafeNet (p. 224)
- Deepnet

Second level of authentication is more secure because instead of using a standard username and password, it uses a static username and a one-time password generated by a token.

Second Level Authentication can be configured on the **Second Level Authentication** tab in the **Connection** category.

Using RADIUS

The below diagram shows a typical Parallels Remote Application Server scenario with Parallels Publishing agent connected to a Radius server.

To configure Radius properties:

- 1 In the Parallels RAS Console, navigate to the **Connection > Second Level Authentication** tab.

- 2 In the **Provider** drop-down list, select **Radius**.
- 3 Click the **Settings** button. The **Radius Properties** dialog opens. On the Connections tab page, specify the following options:
 - **Type Name:** Specify the name of the OTP connection type that will be displayed on the Logon screen on the client side. This should be the name that your users will clearly understand.
 - **Server:** Enter the hostname or IP address of the Radius Server.
 - **Port:** Enter the port number for the Radius Server. Click the **Default** button to use the default value.
 - **Timeout:** Specify the packet timeout in seconds.
 - **Retries:** Specify the number of retries when attempting to establish a connection.
 - **Secret Key:** Type the secret key.
 - **Password Encoding:** Choose from PAP (Password Authentication Protocol) or CHAP (Challenge Handshake Authentication Protocol), according to the setting specified on the Radius Server.
- 4 Click the **Check connection** button to validate the connection. If the connection is configured correctly, you will see a confirmation message.
- 5 If your Radius vendor requires specific attributes, click the **Attribute** tab and then click **Add**. In the Radius Attribute dialog, specify the following:
 - In the **Vendor** drop-down list, select a vendor.
 - In the **Attribute** list, select a vendor attribute.
 - In the **Value** field, enter a value for the selected attribute type (numeric, string, IP address, date, etc).
- 6 Click **OK** and then click **OK** again to close all dialogs.

Using SafeNet

SafeNet Token Management System provides a high-value of protection via secure tokens which makes it a perfect tool for second-level authentication in Parallels Remote Application Server.

In this section:

- Configuring SafeNet (p. 224)
- Configure Parallels RAS Web Portal for SafeNet (p. 226)

Configuring SafeNet

To configure SafeNet:

- 1 In the Parallels Remote Application Server console, navigate to the **Connection / Second Level Authentication** tab.

- 2 In the **Provider** drop-down list, select **SafeNet**.
- 3 Click the **Settings** button. The **SafeNet Properties** dialog opens.
- 4 On the **Connection** tab page, enter the valid URL into the **OTP Service URL** field. To verify that the connection with the OTP Service can be established, click the **Check connection** button.

Note: RAS Publishing Agent communicates with the SafeNet Token Management System Server. It is highly recommended to have this behind a firewall for security reasons.

- 5 Click the **Authentication** tab.
- 6 In the **Mode** drop-down list, select how you want your users to be authenticated.

Mandatory for all users: Every user using the system must login using two-factor authentication.

The available modes are:

- **Create token for Domain Authenticated Users:** Allows Parallels Remote Application Server to automatically create software tokens for Domain Authenticated Users. Choose a token type from the drop down list. Note that this option only works with software tokens.
- **Use only for users with a SafeNet account:** Allows users that do not have a SafeNet account to use the system without having to login using two-factor authentication.

- 7 In the **TMS Web API URL** field, enter the location of the SafeNet API URL.
- 8 In the **User Repository** field, enter the user repository destination.
- 9 Click **OK** to save the values and close the **SafeNet Properties** dialog.

Parallels Client

In the **Parallels Client — New Account Info** dialog:

- 1 Enter any four digits in the **OTP PIN** number field (these digits will be required further on in the process).
- 2 Enter your email address and then click on **OK**.
- 3 Log into your email account and retrieve the email containing the information you will need to activate your SafeNet authentication. An example of this email is shown below.

Activation Key: YZQHoczZWw3cBCNo

Token Serial: 4F214C507612A26A

Download MobilePASS client from:

<http://localhost:80/TMSService/ClientDownload/MobilePASSWin.exe>

**Login with domain credentials.*

**Place the attached seed file in the same folder as the MobilePASS client.*

Enter the One-Time Password to log into the RD Session Host Connection.

Application PIN: 4089

- 4 Download the MobilePASS client from the URL provided in the email.
- 5 Enter the Activation Key found in the SafeNet email.
- 6 Next, input the application PIN found in the email into the **MobilePASS PIN** field.
- 7 Click **Generate** to generate the eToken number and then click **Copy**.
- 8 Combine the OTP PIN and eToken in this order: OTP + eToken.
- 9 Enter this value into the Parallels Client and click **OK** to log in.

Configure Parallels RAS Web Portal for SafeNet

If SafeNet second level Authentication is enabled, logging to Parallels RAS Web Portal also requires second level authentication.

- 1 Enter any four digits in the **OTP Pin** number field (these digits will be required further on in the process).
- 2 Enter your email address and then click the **Send OTP** button.
- 3 Log into your email account and retrieve the email containing the information you will need to activate your SafeNet authentication. An example of this email is shown below.

Activation Key: YZQHoczZWw3cBCNo

Token Serial: 4F214C507612A26A

Download MobilePASS client from:

<http://localhost:80/TMSService/ClientDownload/MobilePASSWin.exe>

**Login with domain credentials.*

**Place the attached seed file in the same folder as the MobilePASS client.*

Enter the One-Time Password to log into the RD Session Host Connection.

Application PIN: 4089

- 4 Download the MobilePASS client from the URL provided in the email.
- 5 Enter the Activation Key found in the SafeNet email.
- 6 Next, input the application PIN found in the email into the **MobilePASS PIN** field.
- 7 Click **Generate the eToken** number and subsequently **Copy**.
- 8 Combine the OTP PIN and eToken in this order: OTP + eToken.
- 9 Enter this value into the Parallels RAS Web Portal and click **OK** to log in.

Using Deepnet

This section describes how to configure and use Deepnet for second level authentication.

In this section:

- Configuring Deepnet (p. 227)

- Configuring Parallels RAS for Deepnet (p. 230)
- Creating User Accounts on Deepnet (p. 231)
- Connecting to a RAS Farm with Deepnet (p. 232)
- Working with DualShield (p. 233)

Configuring Deepnet

Start by logging into the machine where Deepnet Unified Authentication is installed and open your Internet browser. Since Deepnet is installed locally, use 'localhost' as the URL followed by the port number which the Deepnet server will use to communicate with your applications (ex: <http://localhost:8080/>).

You must then log into the Deepnet Management Console with the credentials that you had set during the installation.

Servers

Ensure that the Communication Server, Connection Server and Authentication Server are properly configured. For further information please refer to Deepnet Unified Authentication Platform Administration Guide.

The screenshot shows the 'Connection Server Settings' page in the Deepnet Unified Authentication Platform. The page has a blue header with the platform name and logo. A green 'Menu' sidebar on the left lists various options, with 'System Settings' highlighted. The main content area is titled 'Connection Server Settings' and includes a breadcrumb trail 'Home > System Settings > Connection Server'. There are two tabs: 'Connection' (active) and 'Configuration'. The 'Connection' tab contains two sections: 'External' and 'Internal'. Each section has three fields: 'Server Address' (with value 'deepnetserver'), 'Server Port' (with value '8081'), and 'Use SSL' (checkbox). Red asterisks are next to the 'Server Address' and 'Server Port' fields in both sections. At the bottom are 'Save' and 'Cancel' buttons.

RAS Publishing Agent will communicate with the Authentication Server. It is highly recommended to have this behind a Firewall for security reasons. Make sure that the **Server Address** and **Server Port** are correct.

Gateways

Email or SMS Gateways must be configured correctly so that the Deepnet server is able to send information, such as Activation codes, to the users.

The screenshot shows the 'Email Gateway Settings' page in the Deepnet Unified Authentication Platform. The page has a blue header with the platform name and logo. A green 'Menu' sidebar on the left lists various options, with 'System Settings' highlighted. The main content area is titled 'Email Gateway Settings' and includes a breadcrumb trail 'Home > System Settings > Email Gateway Settings'. The settings are organized into a table with the following fields: 'SMTP Server Address' (value '127.0.0.1'), 'SMTP Server Port' (value '25'), 'Requires Authentication' (checkbox), 'Transport Layer Security (TLS)' (checkbox), 'User Name' (empty), and 'Password' (empty). Red asterisks are next to the 'SMTP Server Address' and 'SMTP Server Port' fields. At the bottom are 'Save' and 'Cancel' buttons.

The E-Mail Gateway and/or SMS Gateway must be configured to be able to send messages to the user. Enter the **SMTP Server Address** and **SMTP Server Port** of the server which will be used by the Deepnet Unified Authentication to send e-mails. Remember to enter any username or password used for the SMTP server.

Templates

Templates are used to set the structure of e-mails and SMS messages sent by the server. The SMS template allows you to set the text for the **Sender** field, the message content and an optional subject. Make sure that you use the preset wildcards to send unique information such as the One-Time Password ([[OTP]]).

Deepnet Unified Authentication Platform

DEEPNET SECURITY

Menu

- Applications
- Token Repository
- System Settings
- Event Filters
- Search for Users
- Search for Tokens
- Audit Trail
- Sign Out

Send One-time Password Templates

Home > System Settings > OTP Template

SMS Template SMTP Template

From: admin@company.com *

Subject: One-Time Password *

Body:

(for One-Way OTP)

Your one-time password: [[OTP]] *

(for Two-Way OTP)

Your one-time password: [[OTP]] *

Server one-time password: [[SOTP]] *

Format: ☐ HTML ☒ Plain Text

Priority: ☐ Low ☒ Mid ☐ High

Note: Use the following wildcards:

- [[OTP]] : User's One-Time Password
- [[SOTP]] : Server's One-Time Password

Save Cancel

The E-mail template allows you to set the e-mail address that the user can reply to. This should be set to the administrator's e-mail. You can also set the e-mail's **Subject**, **Priority** and **Format**. The **Body** contains the actual content of the e-mail which should include the preset wildcard for the unique information along with a message.

Applications

The screenshot shows the 'New Application' form in the Deepnet Unified Authentication Platform. The interface has a blue header with the platform name and logo. A green sidebar menu on the left lists various options, with 'Applications' highlighted. The main form area is titled 'New Application' and contains a breadcrumb 'Home > Application > New'. It features several input fields: 'Icon' with a 'Browse...' button, 'Name' (containing 'VirtualDesktopServer' and a red asterisk), 'Description', 'ID' (containing '001' and a red asterisk), 'Service URL' (containing 'http://deepnet:8081/dcs/service'), and 'Application URL'. There are also checkboxes for 'Primary' and 'Connect to LDAP'. At the bottom, there are 'Save' and 'Cancel' buttons.

Click on **New** to add a new application. From the new form that loads you only need to set a **Name** and an **ID**. Once this is done, click **Save** to save your settings.

Token Repository

If using hardware tokens such as SafeID the token information must first be imported using the XML file provided. Click on **Import** and browse for the XML file provided. After the XML file has been imported each hardware token must be assigned to a user.

Configuring Parallels RAS for Deepnet

List of Supported Tokens

- SafeID
- FlashID
- MobileID
- QuickID
- GridID
- SecureID (RSA)
- DigiPass (Vasco)

Connect to Deepnet Unified Authentication

- 1 In the RAS Console, select the **Connection** category and then click the **Second Level Authentication** tab.

- 2 In the **Provider** drop-down list, select **Deepnet** and click the **Settings** button. The **Deepnet Properties** dialog opens.
- 3 On the **Connection** tab page, enter the server name and port that you saved while setting up your Authentication Server. By default, the port number is set to 8080. Click on **Check Connection** to test that your Authentication Server can be reached. You can choose to connect over SSL to your Deepnet server.
- 4 Click the **Application** tab page.
- 5 Select the application profile that will use Deepnet to authenticate its users. You can also create an application which will be added on the Deepnet server.
- 6 The **Default Domain** field enables you to choose the default domain user for authentication and when users are added. Any Deepnet user accounts imported or verified will be done so using this default domain.
- 7 Select the **Use LDAP** option when importing Deepnet user accounts and a group that contains other sub-groups.
- 8 Click the **Import Deepnet user accounts...** button to automatically add the specified users/groups to the Deepnet application.
- 9 Click the **Verify Deepnet user account names** button to check that all users in the Deepnet application are in the following format: `\\domain\\username`. Users added in the format of `username@domain` will be automatically changed to the appropriate format and users without a domain will have the default domain assigned to them.
- 10 Click the **Authentication** tab page.
- 11 In the **Mode** drop-down list, select the mode how you want your users to be authenticated:
 - **Mandatory for all users** means that every user using the system must log in using two-factor authentication.
 - **Create token for Domain Authenticated Users** will allow RAS Application Server to automatically create software tokens for Domain Authenticated Users. Choose a token type from the drop down list. Note that this option only works with software tokens.
 - **Use only for users with a Deepnet account** will allow users that do not have a Deepnet account to use the system without have to login using two-factor authentication.
- 12 In the **Allow Channels** section, you can specify what channels are available to the user to activate the token or when requesting a Quick ID OTP. For example, if you select **Email**, the activation code can be sent only via email. If you select **SMS**, the activation code is sent via SMS.

Creating User Accounts on Deepnet

When adding new user accounts on Deepnet, it is important that the domain name is included with the **Login Name** of the user, therefore the entry should be in the following format:
`\\domain\\username`.

Users created automatically by Parallels applications are already in that format but users imported from the Deepnet console must be corrected.

To correct the usernames:

- 1 Open the **Deepnet Properties** dialog (**Connection > Second Level Authentication > Settings**).
- 2 Select the **Application** tab.
- 3 Click the **Verify Deepnet user account names** button.

Note that users added in the format of username@domain will be automatically changed to the appropriate format (\\domain\username).

Connecting to a RAS Farm with Deepnet

Parallels Client

Once Deepnet is enabled, the users will have two-factor authentication. If using software tokens such as QuickID the administrator does not have to create a token for each user. RAS Publishing Agent will automatically create the token when the user tries to log in for the first time.

When a user tries to access a Parallels Connection from Parallels Client, he/she is first prompted for the Windows username and password. If the credentials are accepted, RAS Publishing Agent will communicate with the Deepnet server to create a unique token for that user.

The token then needs to be activated. Click on a button to send the activation code by e-mail or by SMS depending on the channel selected when configuring Authentication section. A message will then be sent containing the token activation code which will need to be inserted in the **Activation code** text box.

If using MobileID or FlashID, an email about where you can download the appropriate software will be sent to the user.

If using QuickID tokens, the application will ask for a One-Time Password which is sent by e-mail or SMS.

If using a GridID, the user is given the opportunity to print the grid from the client itself. Note that this is only available the first time the user logs on.

Parallels Web Portal

If Deepnet Unified Authentication is enabled, logging into Parallels Web Portal also requires Second-Level Authentication.

Working with DualShield

DualShield 5.6+ Authentication Platform

This section explains how to integrate Deepnet DualShield Authentication Platform 5.6 or higher with Parallels Remote Application Server 10.6 or higher. If using any other version prior to the stated version please use RADIUS interface.

You may also read the following documentation on DualShield Authentication Platform:

- 1 DualShield Authentication Platform – Installation Guide
- 2 DualShield Authentication Platform – Quick Start Guide
- 3 DualShield Authentication Platform – Administration Guide

List of Supported Tokens by Parallels Remote Application Server

MobileID (FlashID is not integrated with MobileID)

- 1 QuickID
- 2 GridID
- 3 SafeID
- 4 SecureID (RSA)
- 5 DigiPass (Vasco)

If using hardware tokens such as SafeID the token information must first be imported. Click on 'Import' and browse for the XML file provided. After the XML file has been imported each hardware token must be assigned to a user.

In this section:

- Configuring DualShield 5.6+ Authentication Platform (p. 233)
- Configuring Parallels Remote Application Server to Use DualShield Authentication Platform (p. 237)
- Connect to a RAS Farm (p. 240)
- Parallels Web Portal (p. 240)

Configuring DualShield 5.6+ Authentication Platform

After following all the specified steps in “DualShield Authentication Platform – installation Guide” a URP is automatically opened on your internet browser ([http:// localhost:8073](http://localhost:8073)) which allows you to logon to the Management Console of DualShield.

Connection and Authentication Settings

Login in to the DualShield Management Console with the default credentials (User: sa, Password: sa). You will be prompted to change the default password.

Applications are set to provide a connection to realm, as the realm contains domains of users who will be allowed the access to the application.

Realm is set for multiple domain users to be able to access the same application.

You need to create an Application which Parallels Remote Application Server will communicate with. Click on **Authentication > Application Wizard** and enter the information shown below and press **Next**.

The screenshot shows a dialog box titled "Application Wizard" with a close button (X) in the top right corner. The "General Info" tab is selected, indicated by a blue underline. The dialog contains four labeled input fields:

- Application Name:** A text input field.
- Application Type:** A dropdown menu.
- Identity Source Type:** A dropdown menu with "LDAP" selected.
- Provider:** A dropdown menu with "Active Directory" selected.

At the bottom right of the dialog, there are three buttons: "Next >" (highlighted), "Finish", and "Cancel".

Specify the LDAP Server settings as shown below and press **Finish**.

The image shows a Windows-style dialog box titled "Application Wizard". Inside, the "LDAP Settings" section contains several input fields: "LDAP Server URL:", "Access User:", "Access Password:", "Confirm Password:", "Base DN:" (with a "Browse..." button), "Domain Name:", "Domain DNS Name:", and "Domain NetBios Name:". A red text message states: "LDAPS is mandatory for certain features, such as resetting AD password". At the bottom, there are four buttons: "< Previous", "Next >", "Finish", and "Cancel".

After you have configured the application you need to configure an Email or SMS gateway which are used by DualShield server to communicate with the end user. In this document we will be using an Email gateway. Select Gateways from the Configuration menu.

Configure your email gateway.

Configuring Parallels RAS to Use the DualShield Authentication Platform

To begin:

- 1** In the RAS Console, navigate to the **Connection / Second Level Authentication** tab page.
- 2** In the **Provider** drop-down list, select **Deepnet**.
- 3** Click the **Settings** button.

- Click the **Check Connection** button to test that the authentication server can be reached and to verify that the RAS Console is registered as a DualShield agent. If you see the "DeepNet server not valid" message, you have either specified an incorrect server information or you need to allow auto registration of the Parallels components as a DualShield agent.
- Go back to the DualShield Management Console and select **Agents** from the **Authentication** menu as shown below.

- Select **Auto Registration**.

- Select the **Enabled** option and set the date range.

- 8 Once the Agent Auto Registration is set, go back to the RAS Console and select **Yes**. You should see a message that the Dual Shield agent has been successfully registered.

Please note that All RAS Publishing Agents must be registered with Deepnet DualShield server. If you are using Backup Publishing Agents, you need to close all open windows until you can press **Apply** in the RAS Console. This will inform all the agents to self-register as DualShield agents.

- 9 In the Deepnet Properties dialog, click the **Applications** tab and browse for the Application name previously created from the DualShield Management Console.

- 10 Click the **Authentication** tab and select how you want your users to be authenticated:

- **Mandatory for all users** means that every user using the system must log in using two-factor authentication.
- **Create token for Domain Authenticated Users** will allow Parallels Remote Application Server to automatically create software tokens for Domain Authenticated Users. Choose a token type from the drop down list. Note that this option only works with software tokens, such as QuickID and MobileID
- **Use only for users with a DualShield account** will allow users that do not have a DualShield account to use the system without have to login using two-factor authentication.

- 11 Go back to the **Connection > Second Level Authentication** tab page.

- 12 In the Exclusion section, specify the exclusion rules:

- **User / Group exclude list** allows you to add users or groups within your active directory that will be excluded from using DualShield Authentication.
- **Client IP exclude list** allows you to add IP addresses or a range of IP addresses that will be excluded from using DualShield Authentication.
- **Client MAC exclude list** allows you to add MAC addresses that will be excluded from using DualShield Authentication. You can also specify a MAC address range using double question marks as a wildcard in any part of the address. For example, 00-14-22-01-23-??, 00-14-22-01-??-??, or 00-14-22-??-??-??.
- **Connection to the following Gateway IPs** allows you to set a Gateway where users connected to the Gateway will be excluded from using DualShield Authentication.

Connect to a RAS Farm

Parallels Client

Once DualShield has been enabled the users will have two-factor authentication. If using software tokens such as QuickID the administrator does not have to create a token for each user. RAS Publishing Agent will automatically create the token when the user tries to log in for the first time.

When a user tries to access a RAS Connection from Parallels Client, he/she is first prompted for the Windows username and password. If the credentials are accepted, RAS Publishing Agent will communicate with the DualShield server to create a unique token for that user.

If using MobileID or QuickID an email about where you can download the appropriate software will be sent to the user.

If using QuickID tokens, the application will ask for a One-Time Password which is sent by e-mail or SMS.

When asked for OTP, enter the One-Time Password to log into the Parallels ApplicationServer XG Gateway.

Parallels Web Portal

If DualShield Unified Authentication is enabled, logging to Parallels Web Portal also requires Second-Level Authentication.

Configuring Exclusion Rules

When second-level authentication is enabled in the farm, user connecting to it will have to go through it before they can use published resources. If needed, you can exclude select client computers from this requirement and let them authenticate through Active Directory only.

Exclusions rules can be specified in the **Exclusion** section of the **Second Level Authentication** tab page as described below.

To exclude client IP addresses:

- 1 Select the **Client IP exclude list** option and click **Configure**.
- 2 Click **Tasks > Add** and then specify a single IP address or a range of addresses.
- 3 Click **OK**.
- 4 Add additional IP addresses if needed.
- 5 When done, click **OK** to return to the **Second Level Authentication** tab page.

To exclude client MAC addresses:

- 1 Select the **Client MAC exclude list** option and click **Configure**.
- 2 Click the **Add** button and select a client MAC address from the list. You can also specify a MAC address range using double question marks as a wildcard in any part of the address. For example, 00-14-22-01-23-??, 00-14-22-01-??-??, or 00-14-22-??-??-??.

To exclude gateway IP addresses:

- 1 Select the **Connection to the following Gateway IPs** option.
- 2 Type a gateway IP address or expand the drop-down list and select one or more IP addresses from the list. Click the plus sign icon to add the available gateways to the list.
- 3 Click **OK** to save the selection and close the dialog. The IP addresses will appear in the **Connection to the following Gateway IPs** edit box.

Managing Parallels Remote Application Server

This chapter describes general Parallels RAS management tasks, including farm status monitoring, license management, backup management, and some others.

In This Chapter

Parallels Remote Application Server Status	242
Licensing	242
Configuring Monitoring Counters and Email Alerts	243
Viewing Parallels RAS Configuration Changes	245
Configuring Auditing Logging.....	246
Maintenance and Backup.....	247
Problem Reporting and Troubleshooting	249
Suggest a Feature	251

Parallels Remote Application Server Status

The Parallels Remote Application Server has several features which allow you to monitor the activity on the farm and configure system notifications and several other options.

To view the site information, select the **Information** category in the RAS Console. Review the information provided on the **Site Information** page, including available servers, their types, Agent status, CPU utilization, etc. The page also shows the RAS Secure Client Gateway information and other relevant info.

The **Local Information** tab page shows the status of RAS components running on the local server.

Licensing

The **Licensing** category allows you to view and manage your Parallels Remote Application Server license(s).

To manage your license(s), in the RAS console, select the **Licensing** category. The **License Details** tab page in the right pane displays the current license information.

The **View Active Users** button opens a dialog where you can view currently active users and license usage. Use the toolbar buttons to refresh the list and to copy the information to the clipboard.

The **Manage license** button allows you to switch to a new Parallels My Account and to activate Parallels Remote Application Server using a different license key. Click the button to open the **Sign in to Parallels My Account** dialog. This is the same dialog you used when you signed in to Parallels My Account the first time.

If you would like to register a new Parallels My Account, click the **Register** button, fill in the registration form and then click **Register** to create an account. If you now sign-in using the new account, you'll have to activate Parallels Remote Application Server using a different license key, which you must purchase and register in Parallels My Account.

To activate Parallels Remote Application Server using a different license key:

- 1 In the **Sign In to Parallels My Account** dialog, provide the email address and password you used to register your account and click **Sign In**. You'll see the **Activate Product** dialog.
- 2 Select the **Activate using license key** option and enter the key in the field provided. You can click the button next to the field to see the list of subscriptions and/or permanent license keys you have registered with your Parallels My Account. If the list is empty, it means that you don't have any subscriptions or license keys and need to purchase one first.
- 3 To purchase a subscription online, click the **Purchase a license** link.
- 4 You can also activate a trial version of Parallels Remote Application Server by selecting the **Activate trial version** option.
- 5 After entering a license key (or selecting to activate a trial version), click **Activate**. You should see the confirmation message that your Parallels Remote Application Server was activated successfully.

Configuring Monitoring Counters and Email Alerts

On the **Notifications** tab page in the **Administration** category, you can enable, disable, and configure event notifications, which are used to alert the administrator about system events via email. These settings apply to all servers in the farm.

Notifications for the following events are available:

- **CPU utilization is higher than.** The CPU utilization on a server is higher than the amount specified in the **Parameters** column.
- **Memory utilization is higher than.** The memory utilization on the server is higher than the amount specified in the **Parameters** column.
- **Number of sessions is higher than.** The number of sessions connected to a server is higher than the amount specified in the **Parameters** column.

- **Number of disconnected sessions is higher than.** The number of disconnected sessions is higher than the amount specified in the **Parameters** column.
- **RAS Agent has disconnected from or reconnected.** One of the RAS Agents (RD Session Host Agent, Publishing Agent, VDI Agent, RAS Secure Client Gateway) has disconnected or reconnected to the farm.
- **Active Directory.** Active directory is not available. Parallels RAS relies on Active Directory for authentication, SID extraction, group membership and other vital functions. When AD domain controllers become unavailable to RAS Publishing Agents, Parallels RAS is unable to provide any services to end users. To become aware of the problem as soon as possible, enable this option to receive email notifications. You will receive a single email per each failure.
- **Licenses.** License-related events. One notable event here is the license usage reaching a predefined threshold. Specifically, when the license usage reaches 90% of all available licenses, you will receive an email, so you have time to decide whether you have enough licenses or need to add more. Other events include license activation/deactivation, license expiration, grace period starting/ending, license information changes, problem communicating with the licensing server.

In this section:

- Configuring Monitoring Counters (p. 244)
- Configuring SMTP Server Connection for System Notifications via Email (p. 244)

Configuring Monitoring Counters

To configure event notifications:

- 1 In the RAS Console, select the **Administration** category and then click the **Notifications** tab.
- 2 Select an event and specify a value in the **Parameters** column (right-click an event and click **Edit**). Note that with some events, the **Parameter** field is not used and is disabled.
- 3 In the **Notification Interval** field, specify the interval (in minutes) at which the notifications will be emailed to the administrator.

Please note that the mailbox should be configured in the RAS Console for the outgoing email functionality to work. This mailbox is usually set up when you run the RAS Console for the first time and then use the **Start** category to set up your first RAS environment. If you omitted this step, you can set up a mailbox here. The mailbox setup procedure is described in the section that follows this one.

Configuring SMTP Server Connection for Notifications via Email

The **Mailbox** tab page in the **Administration** category allows you to configure an SMTP server for outgoing emails. The SMTP server is required for the administrator to receive system event alerts (as described in the previous section) and to send invitation emails to users.

To configure an SMTP server:

- 1 In the RAS Console, select the **Administration** category and then click the **Mailbox** tab.
- 2 In the **Mail Server** field, type your mail server FDQN or IP address.
- 3 In the **TLS / SSL** drop-down list, select whether to use it the protocol.
- 4 Select the **SMTP server requires authentication** option if required and then type the SMTP server username and password in the fields provided.
- 5 In the **Sender information** section, type the sender email address (e.g your address).
- 6 The **Test mailbox settings** section can be used to test your SMTP server configuration. Enter one or more email addresses separated by a semicolon. Click **Send Test Email** to test the settings.

Viewing Parallels RAS Configuration Changes

The information about any modifications to the Parallels RAS farm configuration is stored in a database, so it can be reviewed later. The information is stored in the master database but is replicated in a local database on the computer where Parallels RAS Console is running.

To view the list of all configuration changes, do the following:

- 1 In the Parallels RAS Console, select the **Administration** category and then click the **Settings Audit** tab.
- 2 The sync process checks that the local audit database is in sync with the master database and will do an update if necessary, during which you will see a message box with the progress indicator.
- 3 Once the syncing is complete, the **Settings Audit** tab page will be populated with data. Each entry in the list corresponds to a modification performed in the RAS Console by a Parallels RAS administrator.

To refresh the list, click the "recycle" icon (top right).

To view details for an entry, double-click it (or select an entry and click **Tasks > View entry**).

To search for a specific entry (or entries), click the magnifying glass icon (top right). An extra row is added at the top of the list allowing you to enter the search criteria. You can type a string to search for in one or multiple columns. The search is performed as you type and the list is filtered to include only the matching entries. To cancel filtering and display the complete list, click the magnifying glass icon again.

Configuring Auditing Logging

By default, auditing is enabled in Parallels RAS. Auditing can be enabled per server or per site, as described in the subsections that follow this one.

To enable and configure auditing in the RAS Console, navigate to **Farm / Site / Settings**.

The auditing log contains information about opened sessions and the total time for each session.

Auditing logs can be configured on the **Auditing** tab page:

- The **Filtering the following processes** list contains processes that will NOT be included in the audit log file produced when the **View Audit** button is clicked. To add or remove a process, click **Tasks > Add** or **Tasks > Delete** respectively. To rename a process, click **Add > Properties**. To reset the entire list and display the default processes, click **Add > Default**.
- To enable or disable auditing, select **Enabled** or **Disabled** in the **Auditing** drop-down list.
- To view the log file, click the **View Audit** button.
- To clear the log files, click the **Clear Audit File** button.
- Use the **Backup log file** drop-down list to specify how often the log file should be backed up. Backup log files are stored in the same directory as other log files. Backup log files can be viewed from the **Backups** node in the RAS Monitor application.

In this section:

- Parallels RAS Logging Per Server (p. 246)
- Parallels RAS Logging Per Site (p. 247)

Parallels RAS Logging Per Server

Parallels Remote Application Server logs are used by Parallels Support for troubleshooting purposes, therefore this type of logging should only be enabled when instructed.

To manage troubleshooting log gathering for a particular server:

- 1** In the RAS Console, navigate to **Farm / Site / RD Session Hosts**.
- 2** Global logging is enabled by default. You can choose whether to use the default (standard) or extended logging.
 - To enable extended logging for a server, right-click the server and choose **Logging > Enable extended logging**. If you open the menu again, a check mark is displayed in front of the **Enable extended logging** item to indicate that it is turned on.
 - To disable extended logging, click **Logging > Enable extended logging** again. If you open the menu now, the check mark should no longer appear.

- 3 To view the log file for a server, right-click the server and choose **Logging > Request Logs**.
- 4 To clear a server log file, right-click the server and then choose **Logging > Clear Log File**.

Parallels RAS Logging Per Site

Global logging is always enabled for all servers in a given site, but you have an option to enable or disable extended logging. Extended logs contain more data than default logs and can provide more information needed to resolve an issue or a problem. Please note that extended logs take more disk space compared to default logs.

To configure extended logging globally:

- 1 In the RAS Console, navigate to **Farm / Site / Settings** and click the **Global Logging** tab.
- 2 The tab page lists servers for which you can configure extended logging. The list has the following columns:
 - **Server** — server name.
 - **Type** — server type (e.g. RD Session Host, Publishing Agent, Gateway).
 - **State** — logging state (level). Can be one of the following: Default and Extended (see the first paragraph above).
- 3 To enable or disable extended logging, select a server in the list and click the **Extended Logging** action item. The **State** column indicates which level is currently set. To switch the level again, click the **Extended Logging** item one more time.
- 4 The **Retrieve** action item retrieves all logs and saves them to a file (you'll need to specify a file name and location).
- 5 The **Clear** action item clears all logs. Note that once you click this item, the logs will be cleared with no additional warning.

Maintenance and Backup

Keeping Parallels RAS up to date

By default, Parallels RAS checks for updates each time the RAS Console is started. If you wish to change this behavior:

- 1 Select the **Administration** category and click the **Settings** tab.
- 2 Select or clear the **Check for updates when launching Parallels RAS Console** option according to your needs.
- 3 To check for updates manually, click the **Check Now** button.

Backing up the Parallels RAS farm configuration

To backup the Parallels RAS farm configuration:

- 1 Select the **Administration** category and then click the **Settings** tab.
- 2 Click the **Export Settings** button.
- 3 You'll see a message box saying that all sites will be synchronized. Click **Yes** to continue with export or click **No** to abort it.
- 4 Specify the file name and target folder and click **Save**.

Note: The export procedure only exports the Parallels RAS farm configuration data. Unrelated objects, such as downloaded OS, etc. are not included in the exported file.

To restore a Parallels RAS farm configuration from a backup file, click the **Import Settings** button and select a backup file (the default file extension is **.dat2**). When you import a configuration from a file, your existing farm configuration will be completely replaced with it.

You can also export and import a Parallels RAS farm configuration from the command line. For complete instructions, please read on.

Exporting and Importing Farm Settings via Command Line

Parallels RAS PowerShell allows you to perform the majority of Parallels RAS administration tasks from the command line.

This section contains information about using PowerShell to export and import farm settings. To learn more about Parallels RAS PowerShell, please visit <http://www.parallels.com/products/ras/resources/> and download (or view online) the **Parallels RAS PowerShell Guide**.

One of the uses of exporting and importing farm settings is running automated tests. Specific configurations can be created, exported, and then imported for specific test scenarios. You can also use this functionality with Windows task scheduler for regular backups of farm settings.

Installing Parallels RAS PowerShell

RAS PowerShell is installed by default when you run the default Parallels RAS installation. If you haven't installed it (or to install it on a different computer), do the following:

- 1 Run the Parallels RAS installer.
- 2 Select **Custom** and then select the **Parallels RAS PowerShell** component.
- 3 Complete the wizard and install Parallels RAS PowerShell.

Using Parallels RAS PowerShell

The complete up-to-date information about Parallels RAS PowerShell can be found in the **Parallels RAS PowerShell Guide**. The guide includes the **Getting Started** chapter to help you quickly get started with Parallels RAS PowerShell, as well as the complete reference and code samples. Please visit <http://www.parallels.com/products/ras/resources/> to view or download the guide.

Use the instructions below to export and import Parallels RAS farm settings.

To import the Parallels RAS PowerShell module, open the PowerShell console and execute the following command:

```
Import-Module PSAdmin
```

Create a Parallels RAS session (use the name or IP address of the server where you have Parallels RAS installed):

```
New-RASSession -Server "server.company.dom"
```

To export farm settings, execute the following command (substitute the path and filename of the backup file with your own):

```
Invoke-ExportSettings "C:\Backup\RAS-backup.dat2"
```

To import farm settings:

```
Invoke-ImportSettings "C:\Backup\RAS-backup.dat2"
```

Problem Reporting and Troubleshooting

If you are experiencing an issue with Parallels Remote Application Server, you can search for a solution right from the RAS Console. If you can't find a solution, you can send a support request to Parallels. This section describes how to accomplish these tasks.

Search for a Solution

To search for a solution from the RAS Console:

- 1 In the console, click **Help** on the main menu and choose **Troubleshooting and Request Support**.
- 2 The **Troubleshooting** dialog opens.
- 3 In the **Select Category** drop-down list, select a category you are having a problem with. The area in the middle of the dialog will be populated with a list of existing KB articles related to that category.
- 4 Click an article of interest to read in a web browser.

- 5 You can also click **Knowledge Base** or **Forum** links to go to the Parallels knowledge base or the Parallels forum.

Request Support

Note: A support request sent to Parallels creates a support ticket, which is then sent to Parallels Support. Please note that if you don't have a current RAS subscription or a support contract, the ticket will NOT be created. In order to receive support, you will need to purchase a subscription or a support contract.

If no articles are found for a given category or if you didn't find a solution for your problem, you can send a support request to Parallels. When you do, the collected logging information is retrieved and attached to the email, so that Parallels Support can analyze it. For more information, please see **Configuring Audit Logging**. (p. 246)

Note: If you already have a request support ticket, you can send just a system report to Parallels without creating an additional (and identical) ticket. See the **Send a Report** subsection below.

Before you request support, please make sure that you have a mailbox setup in the RAS Console. If you haven't set up a mailbox yet, please do it as follows:

- 1 In the RAS Console, navigate to **Administration / Mailbox Setup**.
- 2 Enter your outgoing email server information, your email address, and the security/authentication information if needed.
- 3 You can send a test email by entering an email address in the field provided and clicking the **Send Test Email** button.

To send a support request to Parallels:

- 1 In the **Troubleshooting** dialog, click the **Send Support Request** button.
- 2 The **Contact Support** dialog opens.
- 3 Enter your full name and your company name.
- 4 Enter the subject. This will be used as a subject in the email that will be sent to Parallels Support.
- 5 In the **Enter your query** box, describe the issue the best you can.
- 6 Use the **Attachment** field to attach a file to the email. Click the [...] button to browse for a file. You can attach a picture or any other file that you think might help the Parallels Support to find a solution. Please note that the log files and the Parallels Remote Application Server settings are collected and attached to the email automatically, so you don't have to do it yourself.
- 7 In the drop-down list at the bottom of the dialog, select whether you want to send the email or save it (including the automatically collected information) as a zip file.
- 8 Depending on the action selected in the previous step, click **Send** to send the email or **Save** to save it as a zip file on your local drive or a network folder.

Send a Report

If you already have a support request ticket, you can send just a system report to Parallels without creating a new ticket.

To send a report:

- 1** In the console, click **Help** on the main menu and choose **Upload System Report to Parallels**.
- 2** A dialog opens displaying the progress bar.
- 3** Once the system report data is collected and sent to Parallels, a message box is displayed containing the report number.
- 4** Click **OK** to finish.

Suggest a Feature

If you have an idea of a new feature for Parallels RAS, we would like to hear from you! To suggest a feature, in the RAS Console, click **Help** on the main menu and choose **Suggest a Feature**. This will take you to the **Parallels RAS Feature Suggestion** web page where you can communicate your ideas to us. Please note that you must be signed in using your Parallels Account email address and password to post in the feature suggestion forum.

CHAPTER 21

Appendix

In This Chapter

Port Reference	252
Parallels Client URL Scheme	257

Port Reference

Parallels Remote Application Server v16.1 and later

Table 1: Parallels Client

Source	Destination	Protocols	Destination Ports	Description
Parallels Client	HALB	TCP UDP TCP, UDP	80, 443, 3389 80, 443 20009	• TCP 3389 if RDP Load Balancing is enabled. • If RDP-UDP is used. • Client Manager, shadowing via FW.
	Secure Gateway (Normal and Forwarding modes)	TCP UDP TCP, UDP UDP	80, 443, 3389 80, 443 20009 20000	• TCP 3389 if RDP Load Balancing is enabled. • If RDP-UDP is used. • Client Manager, shadowing via FW only for Normal mode. Since v16 FW GWs don't support client management. • GW Lookup Broadcast
	RDP Session	TCP, UDP	3389	• Connections in Direct Mode 3389 is used. RDP connection is always encrypted.

Table 2: Web Browsers

Source	Destination	Protocols	Destination Ports	Description
HTML5 web browser	Secure Gateway	TCP	443	HTML5 (in Normal mode only).
Web browser	Web Portal	TCP TCP	81 443	- Web portal UI. Actual session uses the Parallels client information. - If SSL enabled.
Web Portal	Secure Gateway	TCP TCP	80, 443	If SSL enabled.

Table 3: Secure Client Gateway

Source	Destination	Protocols	Destination Ports	Description
Secure Gateway in Forwarding Mode	Secure Gateway in Normal Mode	TCP UDP	80, 443, 3389 80, 443	- TCP 3389 if RDP Load Balancing is enabled. - If RDP-UDP is used. Note: Since RAS v16, FW GWs don't support client management.
	RAS Performance Monitor	TCP	8086	Agent (Telegraf service) sends collected performance data to InfluxDB.
Secure Gateway in Normal Mode	Remote Desktop Services	TCP, UDP	3389	RDP Connections.
	Publishing Agent	TCP	20002	TCP 20002 Publishing Agent Service Port - communications with RAS Secure Client Gateways and the RAS Console (in Normal mode only).
	RAS Performance Monitor	TCP	8086	Agent (Telegraf service) sends collected performance data to InfluxDB.
	Localhost	TCP	20020	Communication with NodeJS web server.

Table 4: Publishing Agent

Source	Destination	Protocols	Destination Ports	Description
Publishing Agent	Publishing Agent	TCP	20001, 20030	- TCP 20001 Redundancy Service. - TCP 20030 Communication between Publishing Agents running in the same site.
	Parallels Licensing Server	TCP	443	Outbound TCP 443- Publishing Agent (Master PA in Licensing Site) communicates with Parallels Licensing Server (https://ras.parallels.com).
	RAS Performance Monitor	TCP	8086	Agent (Telegraf service) sends collected performance data to InfluxDB.
	RD Session Host Agent	TCP	30004	TCP 30004 Server for PA requests.
	Parallels VDI Agents	TCP	30006	TCP 30006 VDI Agent Communication Port.
	Parallels Guest Agent	TCP TCP	30004 30005	- TCP 30004 is used by Console during RAS Template creation. - TCP 30005 this is used by components on the destination RDS/guest/remote pc for internal communication. Client does not use it.
	Parallels Remote PC Agent	TCP	30004	Remote PC Agent Communication Port (agent state, counters and session information).
	2FA Server/s	TCP, UDP	8080, 80, 1812, 1813	Deepnet/Safenet/Radius

Table 5: RAS Console

Source	Destination	Protocols	Destination Ports	Description
RAS Console	SQL host with SSRS and Reporting component	TCP	30008	Publishing Agent (RAS Console and Reporting).
	HALB	TCP, UDP	31006	TCP, UDP 31006 configuration.
	Parallels Client	TCP	50005	Shadowing from RAS Console in case of direct network connection.
	Parallels Guest Agent RD Session Host Agent Parallels Remote PC Agent Publishing Agent Secure Gateway	TCP	135, 445, 49179	Remote Install Push/Takeover of Software.
	Parallels Guest Agent Parallels PC Agent Parallels RD Sessions Host Agent	UDP, TCP	30004	- Used for "Check Agent" task. - Used to manage components.
	Parallels VDI Agent	UDP, TCP	30006	- Used for "Check Agent" task. - Used to manage component.
	2FA Server/s	TCP, UDP	8080, 80, 1812, 1813	Deepnet / Safenet / Radius.
	www.turbo.net	TCP	80, 443	When Turbo containerized apps publishing is enabled and used. Used to obtain app categories and available apps metadata for further publishing.
	RAS Performance Monitor	TCP	3000	Performance Dashboard in the Monitoring category (Grafana connection).
	Publishing Agent	TCP	20002, 20001	Communication with PA and Redundancy,

Table 6: RD Session Host / VDI / Guest / Remote PC Agents

Source	Destination	Protocols	Destination Ports	Description
RD Session Host Agent	Publishing Agent	TCP	20003	TCP, UDP 20003 Communications with Publishing Agents
	Localhost	TCP	30005	For internal commands - memshell, printer redirector).
	www.turbo.net	TCP	80, 443	When Turbo support is enabled and used. Used to download Turbo installation package and install / update application containers.
	RAS Performance Monitor	TCP	8086	Agent (Telegraf service) sends collected performance data to InfluxDB.
Parallels VDI Agent	Publishing Agent	TCP	20003	PA Communication Port.
	RAS Performance Monitor	TCP	8086	Agent (Telegraf service) sends collected performance data to InfluxDB
Parallels Guest Agent	VDI Agent	TCP	30006	Communication with VDI Agent
	Broadcast	UDP	30006	Subnet broadcast is sent to find VDI agent.
	Localhost	TCP	30005	For internal commands - memshell, printer redirector.
	RAS Performance Monitor	TCP	8086	Agent (Telegraf service) sends collected performance data to InfluxDB.
Parallels Remote PC Agent	Publishing Agent	TCP	20003	Publishing Agent communication.
	Localhost	TCP	30005	For internal commands - memshell, printer redirector).
	RAS Performance Monitor	TCP	8086	Agent (Telegraf service) sends collected performance data to InfluxDB.

Table 7: HALB

Source	Destination	Protocols	Destination Ports	Description
HALB	HALB	VRRP	112	RAW

Common Communication Ports

Source	Destination	Protocols	Destination Ports	Description
RAS Console	Any host where to which Agents are pushed	TCP	135, 445, 49179	Remote Install Push/Takeover of Software.
Master PA	AD DS controllers	TCP	389, 3268	LDAP
		TCP	636, 3269	LDAPS
		TCP	88	Kerberos
		UDP	53	DNS
	2FA Server/s	TCP, UDP	8080, 80, 1812, 1813	Deepnet / Safenet / Radius.

For Active Directory and Active Directory Domain Services port requirements, please see the following article: <https://technet.microsoft.com/en-us/library/dd772723%28v=ws.10%29.aspx>

Parallels Client URL Scheme

Parallels RAS uses the following URL schemes to perform actions in Parallels Client installed on end user devices:

- **prlclient://** — the scheme that is currently used in Parallels RAS (RAS v15.5 and later versions).
- **tuxclient://** — this is a legacy scheme kept for backward compatibility with older versions of Parallels Client.

The actions that can be performed in Parallels Client include the following:

- Configure a Parallels RAS or RDS connection using specific settings.
- Launch a remote application by specifying the host server, the application itself, and some other parameters.

Parallels Client URL schemes are supported on the following platforms:

- Windows

- macOS
- Linux
- iOS
- Android

Parallels RAS uses URL schemes in invitation emails and in the HTML5 Client. For more information, see **Invite Users** (p. 26) and **Launching Remote Applications and Desktops** (p. 141).

The following table can be used as a reference to parameters used in a Parallels Client URL:

Key	Datatype	Value
Command	String	"LaunchApp" This tells Parallels Client that the intent is to create a connection and / or launch a published resource.
AppID	Int	The application ID to launch (the ID is displayed in the Publishing category in the Parallels RAS Console). If this parameter is empty, Parallels Client will only list the available resources.
Alias	String	A connection name (when creating a new connection).
ConnType	Int	Connection type: • 2 — Standard RDP Connection • 0 — Parallels RAS Connection
ConnMode	Int	Connection mode: • 0 — Gateway • 1 — Direct • 2 — Gateway SSL • 3 — Direct SSL
Server	String	The server FQDN or IP address.
Backup	String	The secondary connection server (if available and required).
Port	Int	The port number.
UserName	String	User name. If this parameter is empty, the user will be prompted to enter a name when connecting to Parallels RAS.
EncPass	String	Encrypted ('hashed') password. If not specified, a user will be prompted for password when connecting.
SessionID	String	The Auth Session ID.
Connect	Boolean	Whether to connect to Parallels RAS right after the connection is configured.
Save	Boolean	Whether to save the connection settings in Parallels Client.
Request Page	String	Used by HTML5 Client to obtain information from Parallels Client.
SSO	String	[Optional] Custom 3rd party SSO GUID. Used only by Windows clients. Currently only used by invitation emails.

HelpDeskEmail	String	[Optional] Help desk/support contact email. Currently only used by Android and iOS clients.
OverrideArgs	String	Override application parameters. Currently only used by Mac client.

Example:

```
prlclient:///?Command=LaunchApp&AppID=2360&Alias=Leonardo+IPv4&ConnType=0&ConnMode=0&Server=10.125.0.50&Backup=&Port=80&UserName=tester56%402x&EncPass=l6Y1%2bf0ryvNHYSI0nWIW4g%3d%3d&SessionID=A78399FE-7077-43AD-8D0A-03641F1C759B&Connect=YES&Save=NO&RequestPage=http://leonardo.2x.testing/2xwebportal/Dashboard.aspx
